Functional Classification by Segment
Pavement Condition Rating by Segment Using Descriptive Terms
$3.26M /year Post Rehab PCI Map

Abbreviation or Acronym	Definition
$k	Dollars in thousands ($,000)
$M	Dollars in millions
%SP	Percent Spreadability - component of deflection analysis
AC	Asphalt Concrete - asphalt streets, flexible pavements, also known as ACP
ACP	Asphalt Concrete Pavement - asphalt streets, flexible pavements, also known as AC
ART	Arterial roadway functional classification
ASTM	American Society of Testing Methods
Avg	Average
BCI	Base Curvature Index - component of deflection analysis
Brk	Break
CAL	Coarse Aggregate Loss
CDV	Corrected Deduct Value - part of the ASTM D6433 PCI calculation
COL	Collector roadway functional classification
Crk	Crack
DeflCON	Deflection Condition - structural load analysis based on traffic loading and deflection
DMD	Dynamic Maximum Deflection - temperature corrected deflection
Dvdd Slab	Divided Slab
DynaCON	Dynamic Condition - structural layer analysis
ft or FT	Foot
ft2 or FT2	Square foot
FunCL	Functional Classification
FWD	Falling weight deflectometer
GCI	Gravel Condition Index
GFP	Good - Fair - Poor
GIS	Geographic Information System
GISID	GIS segment identification number
H&V	Horizontal and Vertical
IRI	International Roughness Index
Jt	Joint
L&T	Longitudinal and Transverse
LAD	Load associated distress
LOC	Local roadway functional classification - same as RES
LOG	Lip of Gutter
m	Metre or meter
M	Moderate
m2	square metre or square meter
MART	Major arterial roadway functional classification
Max	Maximum
MaxDV	Maximum Deduct Value
MCOL	Major collector roadway functional classification
mi or Mi	Mile
Min	Minimum
MnART	Minor arterial roadway functional classification
MnCOL	Minor collector roadway functional classification
MOD	Moderate
NLAD	Non-load associated distress
OCI	Overall condition index, also known as PCI
Olay	Overlay
PART	Primary arterial roadway functional classification
Pavetype	Pavement Type
PCC	Portland Cement Concrete - concrete streets
PCI	Pavement Condition Index - generic term for OCI
R&R	Remove and replace
RART	Rural arterial roadway functional classification
PWF	Priority Weighting Factor
Recon	Reconstruction
Rehab	Rehabilitation
RES	Local roadway functional classification - same as LOC
RI or RCI	Roughness Index
S	Strong
SART	Secondary arterial roadway functional classification
SCI	Surface Curvature Index - componenent of deflection analysis
SDI	Surface Distress Index
SI	Structural Index
STA	Station or chainage
Surf Trtmt	Surface Treatment
TDV	Total Deduct Value
W	Weak

1.0 EXECUTIVE SUMMARY & RECOMMENDATIONS

PROJECT SUMMARY

In 2019, IMS Infrastructure Management Services, LLC (IMS) was contracted by Jacobs Engineering (contracted as CH2M Hill), on behalf of the City of Key West, to conduct a pavement condition assessment and analysis update on approximately 62.5 centerline miles of City maintained asphalt and concrete roadways alike.

IMS mobilized their Laser Road Surface Tester (RST) to conduct an objective assessment using industry standard pavement distress protocols such as those found in ASTM D6433-11. At that time, the City's network average Pavement Condition Index was found to be a 64 and the City's backlog (roads below a PCI of 40) was at 4.8%. *See section 4 for more information*

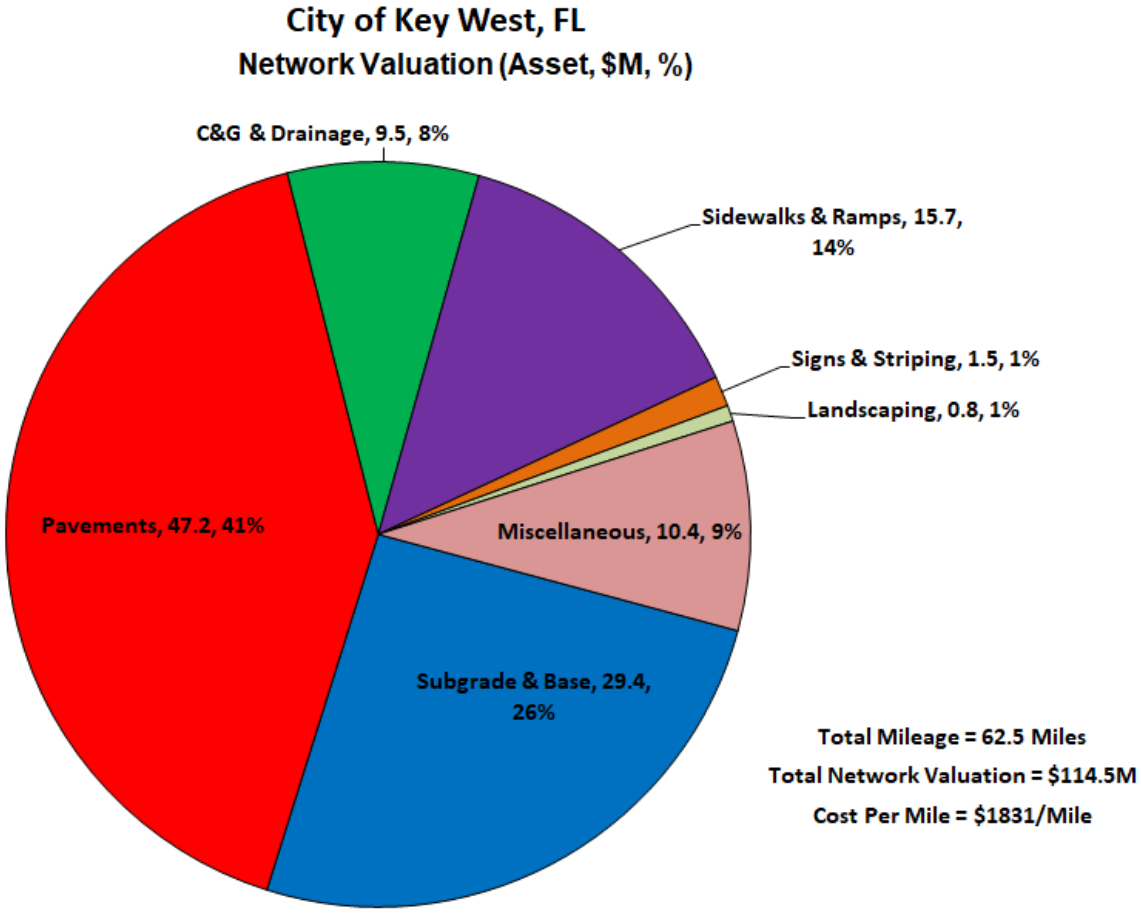

Figure 1- Replacement Value of Roadway Network

As seen in **Figure 1**, Key West has just over 62.5 centerline miles of roadway, encompassing nearly 1.05M square yards of pavement surfacing, which is predominantly asphalt. At an average replacement cost for a typical roadway just over $1.83M per mile, not including the value of the land, the City has over $114M invested in its paved roadway network.

SUMMARY METRICS OF HEALTH

Pavement Condition Index (PCI) – The PCI score is a ranking assessment on the overall health of a pavement segment on a scale of 0 to 100. The network average PCI is a good global indicator of a network's overall health. *(Explained in section 4)*

Percent of Excellent Roads – Roads with a condition category of Excellent are those that score between a PCI of 85 to 100.

Backlog –Backlog is the Very Poor and Poor roads (between a PCI of 0 and 40) that represent a portion of the network in need of extensive rehabilitation such as full and partial reconstruction. Using sound pavement management and finance principals, a very healthy network will have a backlog of 10% or less.

Key West met three out of three of the metrics for evaluating the quality of its roadway network.

- ✓ Key West's network average pavement condition score is within the national average currently seen by IMS clients of 60 to 65. Key West's average network PCI of 64 is a solid base, but is slightly below average compared to other Florida agencies.
- ○ The number of streets rated as Excellent (PCI of 85 and above) is currently at 8.8%, which is below the minimum recommended target of 15%.
- ✓ The backlog amount of 4.8% is well below the maximum value of 15% recommended by IMS.

BUDGET SCENARIOS

See section 5 for more information

The average annual budget for Key West is set at $1.5M per year dedicated to pavement preservation and rehabilitation. If the City maintains this budget, there will be an increase in the backlog to 16% while the average PCI will decrease to 61. Please note this number is an annual budget average across all 5 years of the analysis horizon.

The Steady State PCI budget of $2.16M will maintain the PCI at 64, but will increase the backlog to 14%

IMS recommends a budget of $3.26M annually over the next 5 years as the optimal plan to maintain the network effectively during that period and to optimize the program over ensuing data analysis cycles. This budget level will result in a PCI score of 70 in 5 years. This budget will also target some streets in backlog, but will see backlog increase to a manageable 11%.

EXECUTIVE SUMMARY CONCLUSION

The Key West road network has an average PCI of 64 and a backlog of 4.8%, with most of the network landing in the "Good" PCI range. The overall condition of the network is in a manageable state, though a large portion of the network is trending towards the backlog category. With the City's current $1500k/Yr budget, the network conditions will decrease over the next 5 years, while reconstruction backlog will increase over time.

2.0 PRINCIPLES OF PAVEMENT MANAGEMENT

2.1 PAVEMENT PRESERVATION

Preservation of existing roads and street systems has become a major activity for all levels of government. Because municipalities must consistently optimize the spending of their budgets, funds that have been designated for pavement must be used as effectively as possible. The best method to obtain the maximum value of available funds is through the use of a pavement management system.

Pavement management is the process of planning, budgeting, designing, evaluating, and rehabilitating a pavement network to provide maximum benefit with available funds.

A pavement management system is a set of tools or methods that assist decision makers in finding optimal strategies for providing and maintaining pavements in a serviceable condition over a given time period. The intent is to identify the optimum level of long-term funding to sustain the network at a predetermined level of service while incorporating local conditions and constraints.

Principles of Pavement Preservation

As shown as **Figure 2**, the streets that are repaired while in good condition will cost less over their lifetime than those left to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets require more frequent reconstruction, thereby costing millions of extra dollars.

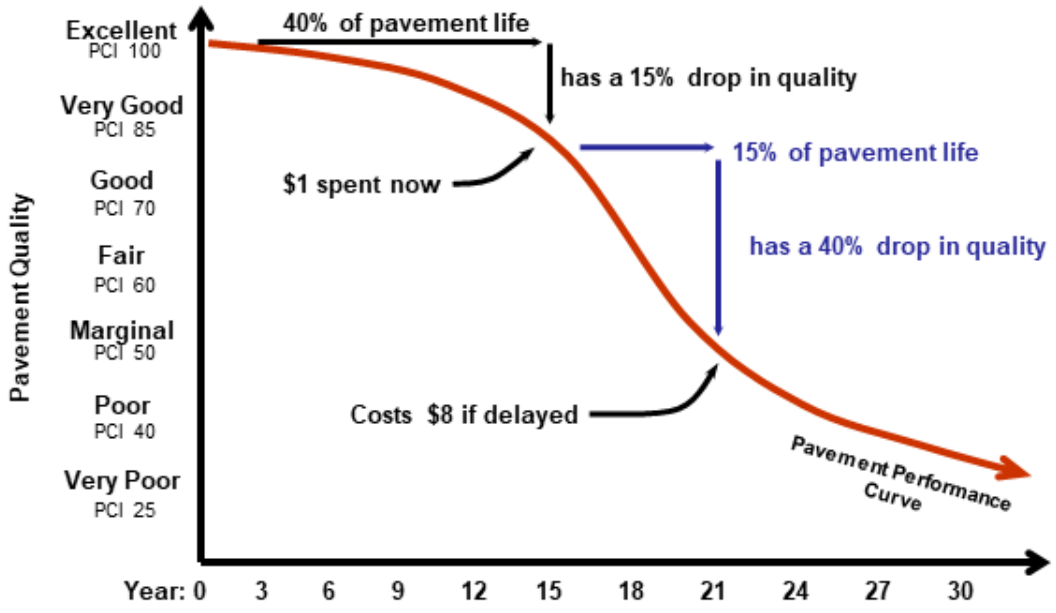

Figure 2 – Pavement Deterioration and Life Cycle Costs

The key to a successful pavement management program is to develop a reasonably accurate performance model of the roadway, and then identify the optimal timing and rehabilitation strategy. The resultant benefit of this exercise is realized by the long term cost savings and increase in pavement quality over time. Pavements typically deteriorate rapidly once they hit a specific threshold. A $1

investment after 40% lifespan is much more effective than deferring maintenance until heavier overlays or possibly reconstruction are required just a few years later.

How Pavement Preservation Affects the Pavement Life Cycle

Once implemented, an effective pavement management system can assist agencies like Key West in developing long-term rehabilitation programs and budgets. The key is to develop policies and practices that delay the inevitable total reconstruction for as long as practical yet still remain within the target zone for cost effective rehabilitation. That is, as each roadway approaches the steepest part of its deterioration curve, apply a remedy that extends the pavement life, at a minimum cost, thereby avoiding costly heavy overlays and reconstruction. **Figure 3** illustrates the concept of extending pavement life through the application of timely rehabilitations.

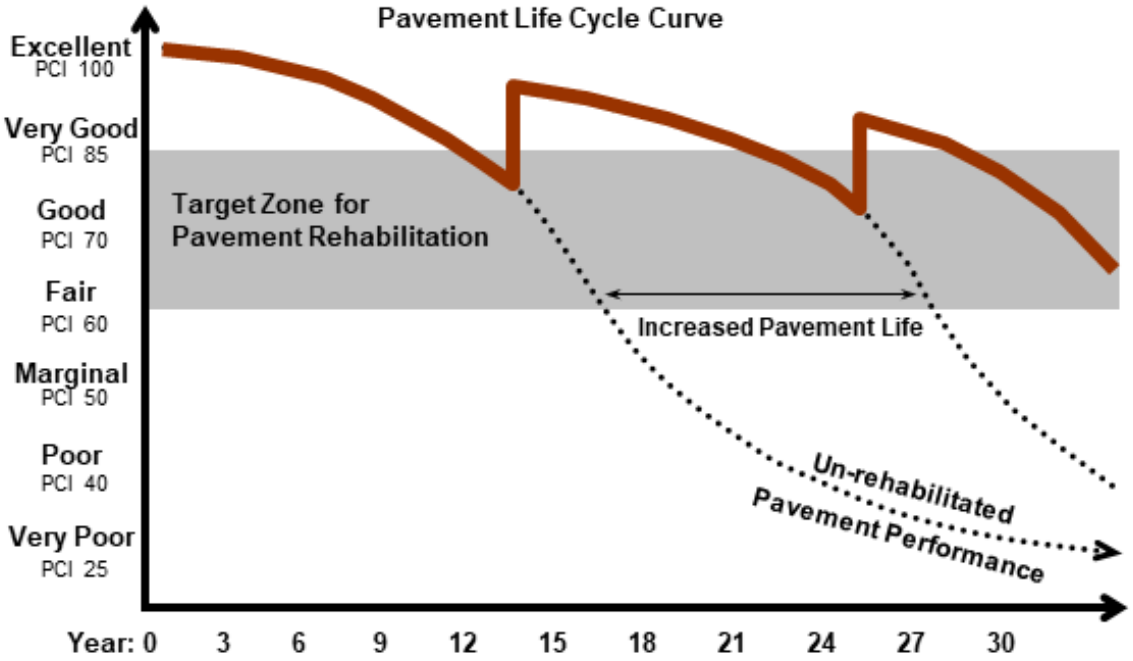

Figure 3 – Pavement Life Cycle Curve

Ideally, the lower limit of the target zone shown in Error! Reference source not found. would have a minimum PCI value in the 60 to 70 range to keep as many streets as possible requiring a thin overlay or less. The upper limit would tend to fall close to the higher end of the Very Good category – that is a pavement condition score approaching 85. Other functions of a pavement management system include assessing the effectiveness of maintenance activities, new technologies, and storing historical data and images.

The analysis methodologies and data collection technologies were based on *ASTM D6433 Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys* (hereinafter ASTM D6433) for assessment of pavement surface condition and the International Roughness Index (IRI) for quantification of pavement roughness on all City streets. These measurements of pavement quality are combined to form an overall 0 to 100 Pavement Condition Index (PCI), with 100 being the best. Section 4.1 provides an understanding and meaning of the Pavement Condition Index (PCI).

2.2 ECONOMIC IMPACTS OF MAINTENANCE & REHABILITATION

The role of the street network as a factor in the City's well-being cannot be overstated. In the simplest of terms, roadways form the economic backbone of a community. They provide the means for goods to be exchanged, commerce to flourish, and commercial enterprises to generate revenue. As such, they are an investment to be maintained.

The overall condition of an agency's infrastructure and transportation network is a key indicator of economic prosperity. Roadway networks, in general, are one of the most important and dynamic sectors in the global economy. They have a strong influence on not only the economic well-being of a community, but a strong impact on quality of life. Well-maintained road networks experience multiple socioeconomic benefits through greater labor market opportunities and decreasing income gap.

As a crucial link between producers and their markets, quality road networks ensure straightforward access to goods and drive global and local economies. Likewise, higher network quality has a strong correlation to improvements in household consumption and income. Roads also act as a key element to social cohesion by acting as a median for integration of bordering regions. This social integration promotes a decreased gap in income along with diversity and a greater sense of community that can play a large role in decreasing rates of poverty.

Conversely, deterioration of roads can have adverse effects on a community and may bring about important and unanticipated welfare effects that the governments should be aware of when cutting transportation budgets. Poor road conditions increase fuel and tire consumption while shortening intervals between vehicle repair and maintenance. In turn, these roads result in delayed or more expensive deliveries for businesses and consumers. Economic effects of poor road networks, such as time consuming and costly rehabilitation, can be reduced if a proactive maintenance approach is successfully implemented. To accomplish this, a pavement assessment and analysis should be completed every few years in an effort update the budget models and rehabilitation strategies. As shown below, the IMS Laser Road Surface Tester (featured in **Figure 4**) was mobilized to Key West to conduct an objective survey.

Figure 4 – Laser Road Surface Tester (RST)

3.0 THE PAVEMENT MANAGEMENT PROCESS

3.1 FUNCTIONAL CLASS REVIEW

As part of the scope of this assignment, the functional classification designations currently used in the Key West pavement management program were adopted for their use in the pavement analysis.

Although there is no uniform standard for classifying pavement into functional classes, The Federal Highway Administration (FHWA), American Public Works Association (APWA) and Institute of Transportation Engineers (ITE) offer some broad guidelines on how to assign classifications that were followed in this study.

The City's functional classification definitions used in the assessment are as follows:

1. **Major Collector (MCOL)** - continuous and discontinuous cross city and inter-district corridors that are 2 to 4 lanes across and generally have a centerline stripe or are a designated bus route. The ADT generally falls in the 1,000 to 10,000 vehicle per day range. They are typical spaced on the ½ or ¼ mile section line and on occasion, may have a short non-landscaped median. Major collectors are also assigned to streets segments leading to, or adjacent to, a major traffic generator site such as a regional shopping complex.
2. **Local (LOC)** – These are the majority of the street segments consisting of all residential roads not defined above or as industrial/commercial.
3. **Local – Old Town** – Due to the unique nature of the geography and density of the City, the Old Town district is listed as a unique functional class for pavement analysis purposes.

The paved roadway network consists of 3 functional classes, covering approximately 62.5 miles of pavement. The average pavement condition index (PCI) of the roadway network is a 64 and the network's primary pavement type is asphalt. The following table and **Figure 5** summarize the functional classification splits within the system.

City of Key West, FL
Network Summary by Functional Class

	Pavetype	Network	Collector	Local	Local - Old Town
Segment (Block) Count	All Streets	1018	145	453	420
	Asphalt	1017	145	453	419
	Concrete	1	0	0	1
Network Length (ft):	All Streets	330,082	40,743	165,262	124,077
	Asphalt	329,933	40,743	165,262	123,928
	Concrete	149	0	0	149

	Asphalt	62.5	7.7	31.3	23.5
	Concrete	0.0	0.0	0.0	0.0
Average Width (ft):	All Streets	28.7	34.1	29.8	25.5
	Asphalt	28.7	34.1	29.8	25.5
	Concrete	22.0	0.0	0.0	22.0
Network Area (yd2):	All Streets	1,053,047	154,343	546,635	352,069
	Asphalt	1,052,682	154,343	546,635	351,704
	Concrete	365	0	0	365
Current Pavement Condition	All Streets	64	71	64	61
Index (CPCI)	Asphalt	64	71	64	61
8/1/19	Concrete	15	0	0	15
Pavement Condition Index	All Streets	63	69	63	61
(Surveyed PCI)	Asphalt	63	69	63	61
	Concrete	15	0	0	15
Current Backlog (%)	All Streets	5			
Current Network Index	All Streets	61			
Surface Distress Index (SDI)	All Streets	68	77	67	66
8/1/19	Asphalt	68	77	67	66
	Concrete	10	0	0	10
Roughness Index (RI)	All Streets	56	60	58	49
8/1/19	Asphalt	56	60	58	49
	Concrete	26	0	0	26
Structural Index (SI)	All Streets	84	81	86	82
8/1/19	Asphalt	84	81	86	82
	Concrete	59	0	0	59

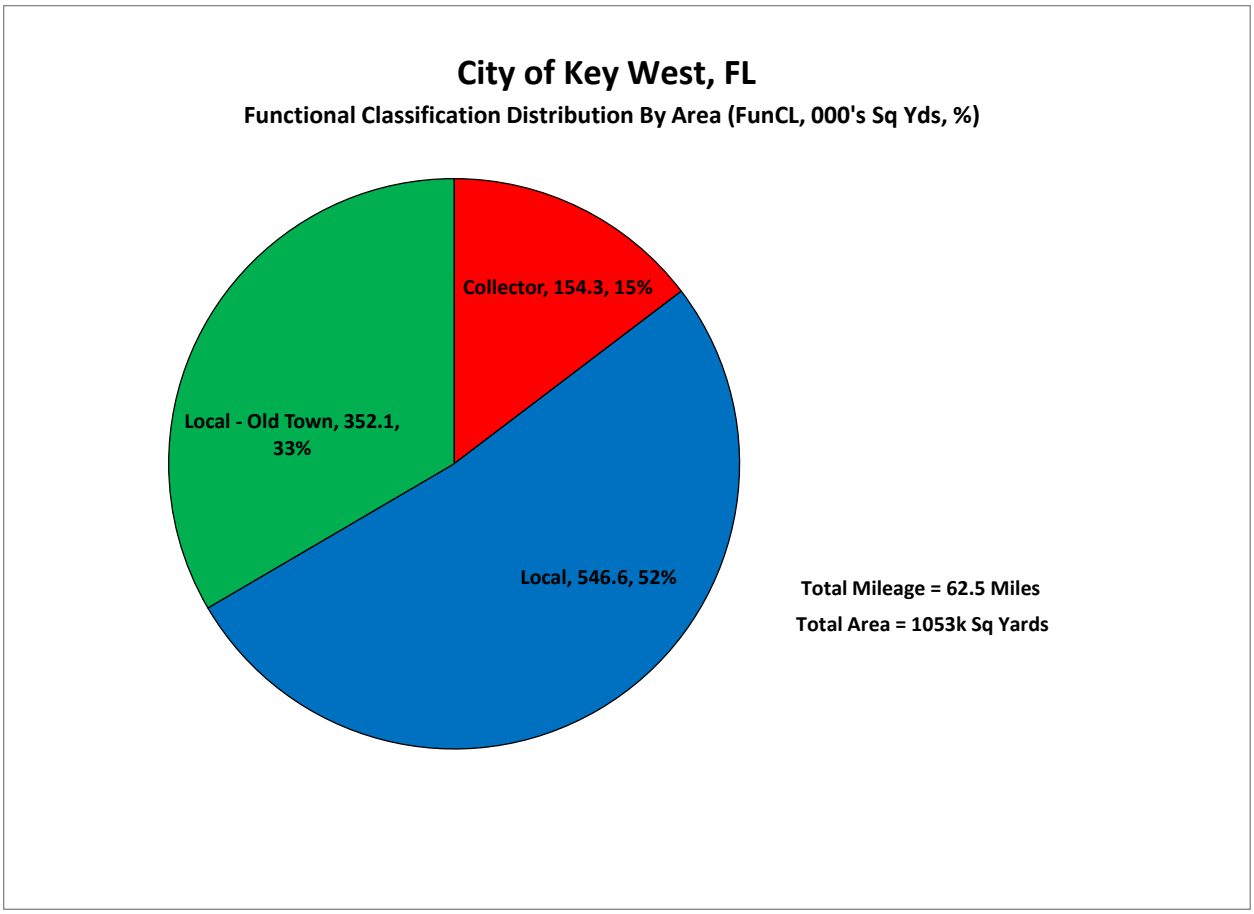

Figure 5 – Functional Class Distribution by Milage

As discussed later in this report, the functional classifications also play a critical role in the rehabilitation candidate selection process as collector roads are generally given preference over other rehab candidates, such as local and residential streets, due to their higher traffic counts and steeper deterioration curves. For Key West, the unique inclusion of the Local Old Town roads will require custom prioritization models.

3.2 ASSEMBLY OF DATA INTO PROJECTS

Key West's Geographic Information System (GIS) was used as the basis for segmenting the roadway network on a block-by-block basis. Each segment was assigned a unique identifier referred to as a GISID, establishing a one-to-one relationship between the GIS and the street inventory. The segments form the basic building block of the pavement management system and are where all attribute and condition data are stored.

The centerline segments were aggregated together within the pavement management system to form logical projects that the analysis and rehabilitation program are developed against.

- Collector projects run from major intersection to major intersection up to 1 mile in length.
- Collector streets within a neighborhood were aggregated together to form a single project where practical.
- Local, and Old Town-Local streets along a homogenous route were aggregated together along with adjacent side streets to form a small neighborhood based approach.

Segments were joined only when the pavement condition and functional classification were homogeneous in nature such that when joined they have a relatively uniform condition that may be rehabilitated using a single strategy.

3.3 FIELD SURVEY METHODOLOGY

Following a set of predefined assessment protocols matching the pavement management software (ASTM D6433), a specialized piece of survey equipment – referred to as a Laser Road Surface Tester (Laser RST, pictured on page 5) – is used to collect observations on the condition of the pavement surface, as well as collect high definition digital imagery and spatial coordinate information. The Laser RST surveys each local street from end to end in a single pass, while all other roadway classifications are completed in two passes.

Key pavement condition data elements collected by the Laser RST include:

Surface Distress Index – The Laser RST collects surface distress observations based on the extent and severity of distresses encountered along the length of the roadway following ASTM D6433 protocols for asphalt and concrete pavements. The surface distress condition (cracking, potholes, raveling, and the like) is considered by the traveling public to be the most important aspect in assessing the overall pavement condition.

Presented on a 0 to 100 scale, the Surface Distress Index (SDI) is an aggregation of the observed pavement defects. Within the SDI, not all distresses are weighted equally. Certain load associated distresses (caused by traffic loading), such as rutting or alligator cracking on asphalt streets, or divided slab on concrete streets, have a much higher impact on the surface distress index than non-load associated distresses such as raveling or patching. Even at low extents and moderate severity – less than 10% of the total area – load associated distresses can drop the SDI considerably. ASTM D6433 also has algorithms within it to correct for multiple or overlapping distresses within a segment.

For this project, extent and severity observations were collected, processed, and loaded into the pavement management software. Within the software, the following distresses, listed in order from greatest to lowest impact, are presented as a 0 to 10 rating for review and reporting:

- Alligator Cracking – Alligator cracking is quantified by the severity of the failure and number of square meters. Even at low extents, this can have a large impact on the condition score as this distress represents a failure of the underlying base materials.
- Wheel Path Rutting – Starting at a minimum depth of 6.35mm, wheel path ruts are quantified by their depth and the number of square feet encountered. Like alligator cracking, low densities of rutting can have a large impact on the final condition score.
- Longitudinal, Transverse, Block (Map), and Edge Cracks – These are quantified by their length and width. Longitudinal cracks that intertwine are the start of alligator cracking.
- Patching – Patching is quantified by the extent and quality of patches. When the majority of a roadway surface is covered by a patch, such as a large utility replacement, the rating of the patch is minimized. All potholes are rated as patches.
- Distortions – All uneven pavement surfaces, such as depressions, bumps, sags, swells, heaves, and corrugations, are included as distortions and are quantified by the severity and extent of the affected area.
- Raveling – Raveling is the loss of fine aggregate materials on the pavement surface and is measured by the severity and number of square meters affected.

- Bleeding – Bleeding is the presence of free asphalt on the roadway surface caused by too much asphalt in the pavement or insufficient voids in the matrix. The result is a pavement surface with low skid resistance and is measured by the amount and severity of the area.
- Similar distresses were collected for concrete streets including divided slab, corner breaks, joint spalling, faulting, polished aggregate, and scaling.

Roughness Index – Roughness is measured following the industry standard "International Roughness Index" (IRI), an open-ended score that measures the number of bumps per mile and reports the value as millimeters/meter. The IRI value is converted to a 0 to 100 score and reported as the Roughness Index (RI) as follows:

$$\mathbf{RI} = (11 - 3.5 \times \ln(IRI)) \times 10$$

ln(IRI) is the natural logarithm of IRI.

In common terms, a newer street would have a Roughness Index above 85, while one due for an overlay would be in the range 40 to 70. Failed streets typically have roughness values below 40.

Structural Index – The full street network was tested for structural adequacy using a Dynaflect deflectometer device. (Pictured Below) The field data is then compared to what loads the road is expected to carry as well as used to develop a layer analysis to evaluate if the base materials and pavement structure are working as a single unit. The final result is a single 0 to 100 index value. Scores above a 75 indicate the pavement is structurally adequate, between a 45 and 75 indicate additional structure is required, and those below a 45 generally require replacement.

Pavement Condition Index (PCI) – Following our field surveys, the condition data is assembled to create a single score representing the overall condition of the pavement. The Pavement Condition Index (PCI) is calculated as follows:

PCI = 33% Roughness Index + 67% Surface Distress Index

Development of the pavement management plan and budgets were completed using Key West-specific rehabilitation strategies, unit rates, priorities, and pavement performance curves. The process was iterative in its attempt to obtain the greatest efficiency and cost benefit.

4.0 KEY WEST SURVEY PAVEMENT CONDITION

4.1 UNDERSTANDING THE PAVEMENT CONDITION INDEX

The following compares the Pavement Condition Index (PCI) to commonly used descriptive terms. Divisions between the terms are not fixed, but are meant to reflect common perceptions of condition.

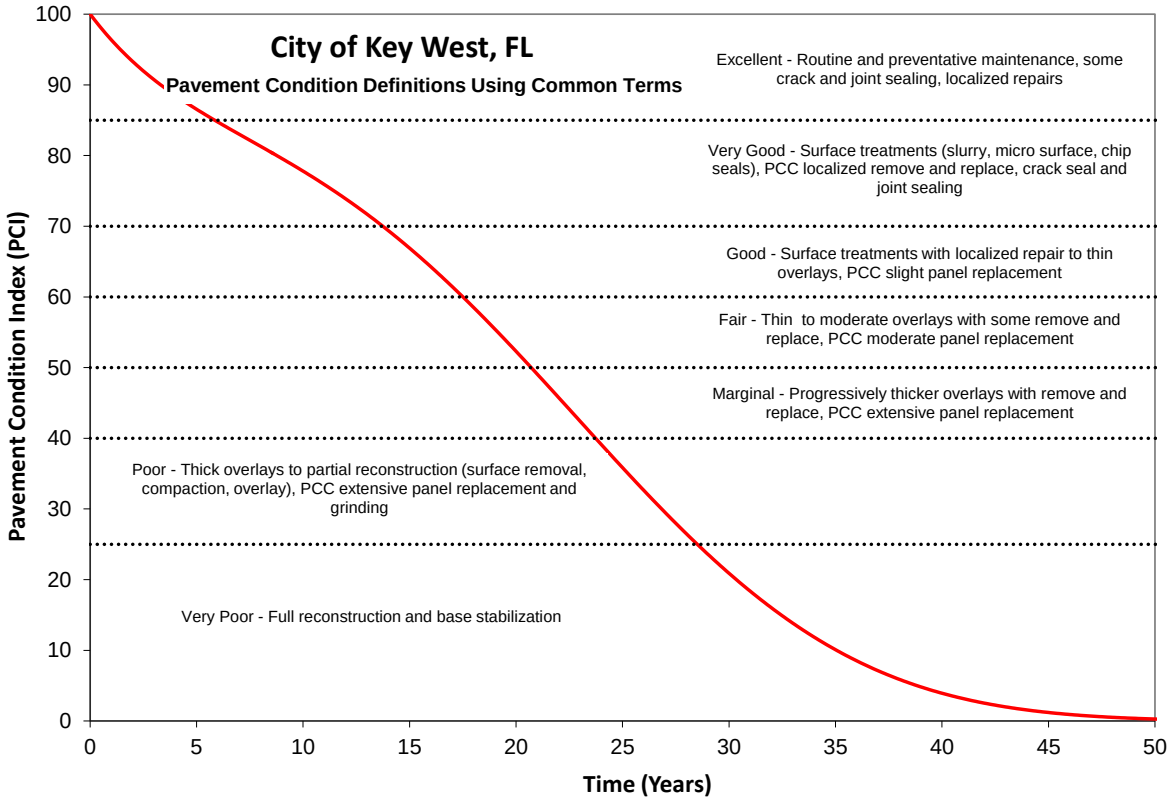

Figure 7 – Understanding the Pavement Condition Index (PCI) Score

The following table details a general description for each of these condition levels with respect to remaining life and typical rehabilitation actions:

PCI Range	Description	Relative Remaining Life	Definition
85 – 100	Excellent	15 to 25 Years	Like new condition – little to no maintenance required when new; routine maintenance such as crack and joint sealing.
70 – 85	Very Good	12 to 20 Years	Routine maintenance such as patching and crack sealing with surface treatments such as seal coats or slurries.
60 – 70	Good	10 to 15 Years	Heavier surface treatments, chip seals and thin overlays. Localized panel replacements for concrete.
40 – 60	Marginal to Fair	7 to 12 Years	Heavy surface-based inlays or overlays with localized repairs. Moderate to extensive panel replacements.
25 – 40	Poor	5 to 10 Years	Sections will require very thick overlays, surface replacement, base reconstruction, and possible subgrade stabilization.
0 – 25	Very Poor	0 to 5 Years	High percentage of full reconstruction.

4.2 KEY WEST NETWORK CONDITION IMAGERY

The images presented below provide a sampling of the Key West streets that fall into the various condition categories with a discussion of potential rehabilitation strategies.

Very Poor (PCI = 0 to 25) – Complete Reconstruction

Duval Street from North West End to Wall Street (GISID 4419, PCI = 15) – Rated as Very Poor, this street displays spreading base failure as evidenced by the severe alligator cracking and patching. The SI (structural index) was rated at a 60, showing moderate strength, enhancing the analysis decisions. A mill and overlay on this street would not be suitable as the base has failed and would not meet an extended service life of at least 15 years. This street requires a full reconstruction and should be carefully monitored.

Deferral of reconstruction of streets rated as Very Poor will not cause a substantial decrease in pavement quality as the streets have passed the opportunity for overlay-based strategies. Due to the high cost of reconstruction, Very Poor streets are often deferred until full funding is available in favor of completing more streets that can be rehabilitated at lower costs, resulting in a greater net benefit to the City. This strategy however must be sensitive to citizen complaints forcing the street to be selected earlier. In addition, this type of street can pose a safety hazard for motorists, since severe potholes and distortions may develop. It is important to consistently monitor these streets and check for potholes or other structural deficiencies until the street is eventually rebuilt.

Poor (PCI = 25 to 40) – Last Opportunity for Surface Base Rehabilitation

Petronia Street from Terry Lane to Whitehead Street (GISID 4129, PCI = 32) – Rated as Poor, this segment still has some remaining life before it becomes a critical reconstruction need. As evident in the imagery, the alligator cracking is well defined and wheel-path rutting is an issue on a local street. On this street, the base is showing signs of failure in areas exhibiting alligator/fatigue cracking. The severely cracked areas do not persist throughout the entire segment length and cross section, but are becoming extensive. These areas should be dug out and structurally patched to attain the maximum life from any potential rehabilitation efforts. If left untreated, within a short period of time, a full reconstruction would be required.

On collector roadways, Poor streets often require partial to full reconstruction – that is removal of the pavement surface and base down to the subgrade and rebuilding from there. On local roadways, they require removal of the pavement surface through grinding or excavation, base repairs, restoration of the curb line and drainage, and then placement of a new surface.

In general, the service life of Poor streets is such that if deferred for too long, it would require a more costly reconstruction. Streets rated as Poor are typically selected first for rehabilitation as they provide the greatest cost/benefit to the City – that is the greatest increase in life per rehabilitation dollar spent.

Marginal (PCI = 40 to 50) – Progressively Thicker Overlays

Pearl Street from Olivia Street to Albury Street (GISID 4021, PCI = 43) – Rated as marginal with a PCI score at the lower range between Marginal and Poor streets. Marginal streets have distresses that tend to be localized and moderate in nature – that is they do not extend the full length of the segment and can be readily dug out and repaired. This street segment highlights this characteristic as the failed area does not quite extend the full length or width of the roadway and is still serviceable. However, it also highlights the relationship between base and pavement quality. Placing an overlay on this street without repairing the base would not achieve a full 15 year life as the failure would continue to occur over time. Structural patching of the failed areas along localized rehabs would permit a full width grind and inlay on this street segment and return it to full service. The curb lines are straight and drainage is functioning well.

Similar to streets rated as Very Poor, Marginal streets that display high amounts of load associated distresses are selected as a priority for rehabilitation as they provide the greatest cost/benefit to the City. If left untreated, Marginal streets with high amounts of load associated distresses would deteriorate to become partial reconstruction candidates. Marginal streets that are failing due to materials issues or non-load associated failures may become suitable candidates for thick overlays if deferred, without a significant cost increase.

Fair (PCI = 50 to 60) – Thin to Moderate Overlays

15th Street from Harriet Avenue to Eagle Avenue (GISID 3182, PCI = 54) – Rated in the Fair category, these streets require thin to moderate overlays for asphalt when they enter their need year (generally within 2-3 points of the lower PCI in the defined range). Several distresses are present, but tend to be more localized and moderate in severity, and non-load related (primarily longitudinal and transverse cracking and raveling). On this segment of road, the signs of deterioration are evident in the left side of the pavement and are moderate in severity indicating the base has not yet failed along the entire length of roadway. The pavement edge is an issue on each side, and could benefit from some preventative maintenance to prevent damage from weed intrusion.

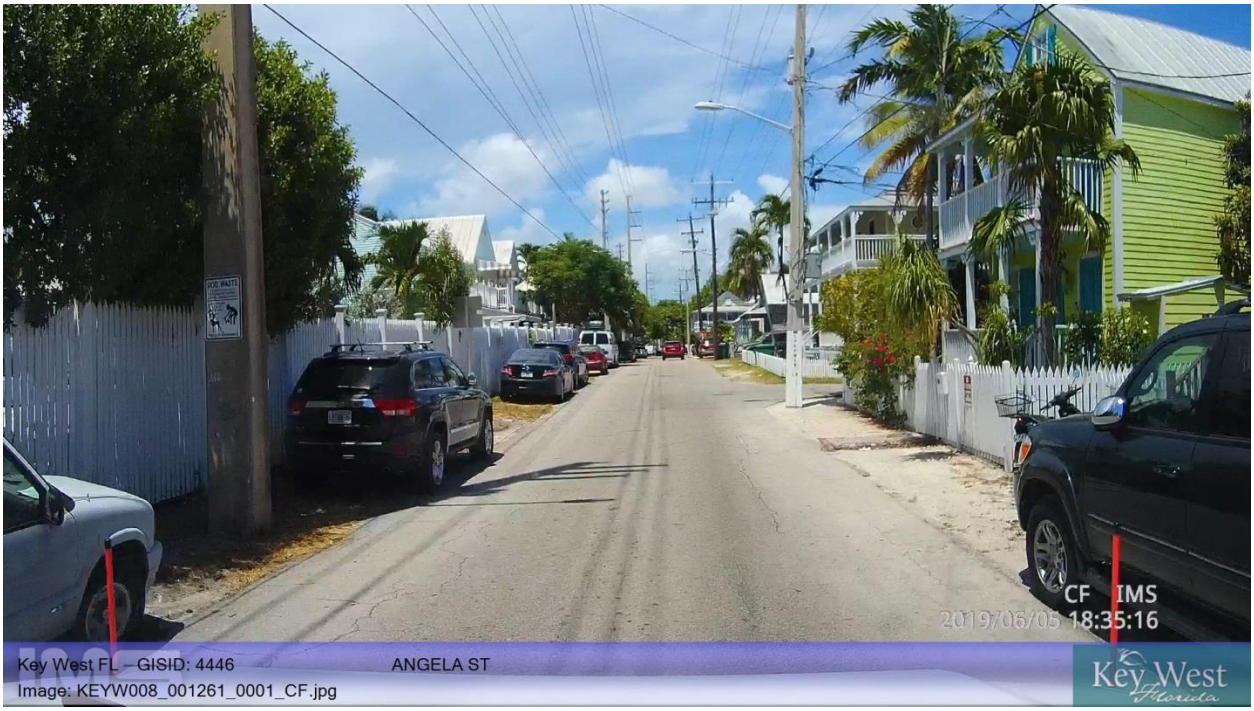
Asphalt streets rated as Fair tend to receive a lower priority when developing a rehabilitation program. The reason for this is the cost to complete an overlay is upwards of $20.00/yd2. If deferred, the rehabilitation cost would only increase by about $4 to $6/yd2, again depending on the functional classification, in about 5 to 10 years. This delay represents a 20% difference over the time stated. Thus, the cost of deferral is low when compared to deferring a thick overlay to a reconstruction with a two to threefold increase in cost.

Good (PCI = 60 to 70) – Surface Treatments to Thin Overlays

Sixth Street from Seidenberg Avenue to Staples Avenue (GISID 3360, PCI = 61) – Rated as Good with the primary cause of deterioration the transverse and longitudinal cracking, as well as minor distortions. It also displays small amounts of load associated distresses that can easily be removed to restore the visual appearance of the roadway. The existing cracks should be sealed and the pavement surface restored, with a heavier surface treatment such as microsurfacing or double slurry to fully waterproof the pavement and cover the crack sealant. The occasional dig out and replacement may be required to correct localized deficiencies. Alternatively, depending on the extent of the distressed areas, base strength and drainage, a thin overlay may be applied.

Asphalt streets rated as Good are ideal candidates for thinner surface-based rehabilitations and local repairs. Depending on the amount of localized failures, a thin edge mill and overlay, or possibly a surface treatment, would be a suitable rehabilitation strategy for streets rated as Good. Streets that fall in the high 60 - low 70 PCI range provide the greatest opportunity for extending pavement life at the lowest possible cost, thus applying the principles of the perpetual life cycle approach to pavement maintenance. The adjacent photo is a great example of a street segment (not a Key West Road) that displayed low load associated distresses and thus, high structural characteristics, and once the distressed areas were replaced, a slurry seal was applied. The patching accounted for less than 5 to 10% of the total area and resulted in a good looking, watertight final surface at a much lower cost than an overlay with less disruption to the neighborhood and curb line. The patches were paver laid and roller compacted.

Very Good (PCI = 70 to 85) – Surface Treatments and Localized Rehabilitation



Angela Street from Chapman Lane to Thomas Street (GISID 4446, PCI = 71) – Rated as Very Good, this road displays minor amounts of longitudinal cracking and edge cracking. The surface is non-weathered, and the base is still strong. This street is an example of a candidate for preventative maintenance and light weight surface treatments to extend the life of a roadway.

Asphalt streets rated as Very Good generally need lightweight surface-based treatments such as surface seals, slurries, chip seals or microsurfacing. Routine maintenance such as crack sealing and localized repairs often precede surface treatments. The concept is to keep the cracks as waterproof as possible through crack sealing and the application of a surface treatment. By keeping water out of the base layers, the pavement life is extended without the need for thicker rehabilitations such as overlays or reconstruction. Surface treatments also tend to increase surface friction and visual appearance of the pavement surface but do not add structure or increase smoothness.

Surface treatments may include:

- *Double or single application of slurry seals (slurries are a sand and asphalt cement mix).*
- *Microsurfacing – asphalt cement and up to 3/8 sand aggregate.*
- *Chip seals and cape seals (Chip seal followed by a slurry).*

Additional cost benefits of early intervention include:

- *Less use of non-renewable resources through thinner rehabilitation strategies.*
- *Less intrusive rehabilitation and easier to maintain access during construction.*
- *Easier to maintain existing drainage patterns.*

Excellent (PCI = 85 to 100)

10th Street from Patterson Avenue to Fogarty Avenue (GISID 3241, PCI = 92) – Rated as Excellent, displaying little to no surface distresses. The ride is smooth and the surface is non-weathered and the base is strong. In a couple of years, this street segment would be an ideal candidate for routine maintenance activities such as crack sealant service.

In terms of pavement management efficiency, a program based on worst-first, that is starting at the lowest rated street and working up towards the highest, does not achieve optimal expenditure of money. Generally, under this scenario, agencies can not sufficiently fund pavement rehabilitation and lose ground despite injecting large amounts of capital into the network.

The preferred basis of rehabilitation candidate selection is to examine the cost of deferral of a street, against increased life expectancy.

4.3 EVALUATING THE PAVEMENT QUALITY AND BACKLOG

The concept of the Pavement Condition Index (PCI) score, backlog percentage and number of streets rated as Excellent must be fully understood in order to understand and develop an effective pavement management program. These three metrics should fall into certain ranges in order to measure the quality and long term viability of a network.

Comparison to the 2012 Survey and Typical Distribution

The bar chart in **Figure 8** displays the distribution of the Key West PCI scores from the 2012 and 2019 field surveys. The chart also includes the "typical" distribution curve for agencies that maintain a PCI score in the 65 to 80 range. This visual displays a positive trend towards the regression curve, and more balance in the distribution of street condition in Key West, relative to the typical curve.

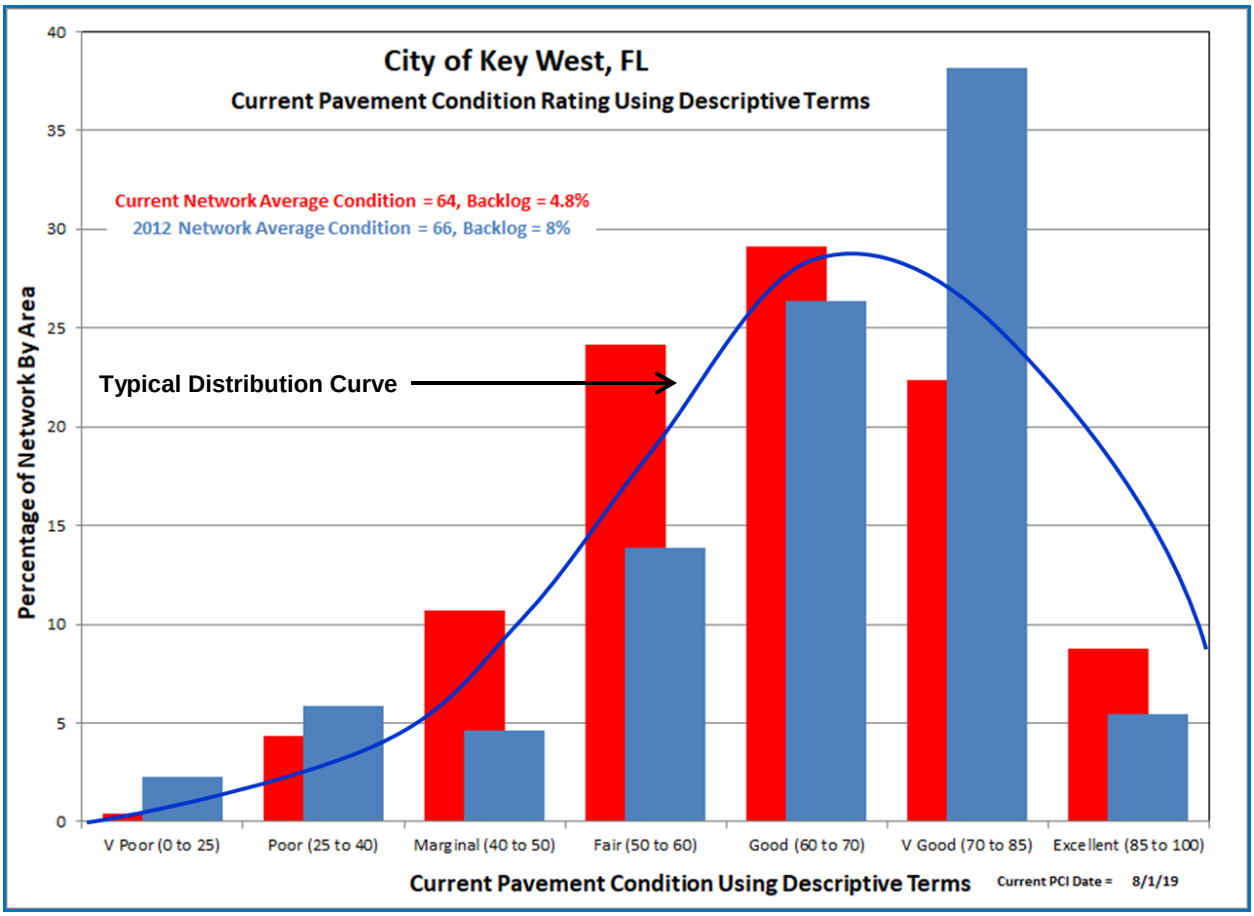


Figure 8 – 2012 and 2019 PCI Comparison to 'Ideal' Distribution Curve

Explanation of the PCI Score

The PCI score indicates the overall pavement condition and represents the amount of equity in the system; it is the value most commonly considered when gauging the overall quality of a roadway network. It may also be used to define a desired pavement condition target: that is, an agency may wish to develop a pavement management program such that in five years the overall network score meets a set minimum value. Obviously, the higher the PCI score the better off the overall network condition is.

Agencies with an average PCI score above 80 (when considering surface distress, roughness and strength) are rare and found only in a few select communities. Less than 1 in 20 communities surveyed by IMS have that high of a condition average. Averages between 65 and 80 are indicative of either newer networks, or ones that have an ongoing pavement rehabilitation program and tend to be fully funded. Scores between 60 and 65 are common and represent a reasonable average providing a satisfactory balance between levels of service and funding, and when taken with the other two metrics may represent a well-managed and funded network. A minimum score of 60 means that overall the network falls at the lower end of the range where light weight surface treatments and thin overlays are the standard rehabilitation practice. Below a 60 means an agency has to rely on more costly rehabilitations and reconstructions to address condition issues.

Understanding the Excellent Category

At the upper end of the condition scale, a minimum of 15% of the network should be rated as Excellent. Generally, at or above 15%, means that a noticeable percentage of the roadway network is in like new condition, requiring only routine maintenance. While higher percentages of streets rated as Excellent are certainly desirable, the annual cost to maintain rates at higher multiples is often cost prohibitive. Below 15% means the agency is struggling to effectively rehabilitate their network on an annual basis. The 15% marker represents a cost effective balance between annual investment and satisfactory level of service.

Backlog: Identifying the Reconstruction Candidates

Backlog roadways are those that have dropped sufficiently in quality to the point where surface based rehabilitation efforts would no longer prove to be cost effective. These roadways are rated Poor or Very Poor (a PCI score of 40 and below) and will require either partial or total reconstruction. Backlog is expressed as the percentage of roads requiring reconstruction as compared to the network totals.

It is the backlog, however, that defines the amount of legacy work an agency is facing and is willing to accept in the future. It is the combination of the three metrics that presents the true picture of the condition of a roadway network, and conversely defines improvement goals.

Generally, a backlog of 10% to 15% of the overall network is considered manageable from a funding point of view with 12% being a realistic target. Fifteen percent (15%) is used as a control limit to indicate the maximum amount of backlog that can be readily managed. Backlog rates below 10%, again are certainly desirable, but financially unachievable for a large percentage of agencies. Backlogs approaching 20% or more tend to become unmanageable, unless aggressively checked through larger rehabilitation programs, and will grow at an alarming rate. At 20% a tipping point has been met and the backlog tends to increase faster than an agency's ability to reconstruct their streets.

4.4 KEY WEST NETWORK CONDITION DISTRIBUTION

Figure 9 presented below shows the distribution of pavement condition for the roadway network in Key West. The average PCI for the network is 64. While direct comparisons to other agencies are difficult due to variances in ratings systems, Key West is within the average when compared to other agencies recently surveyed by IMS, which typically fall in the 60 to 65 range.

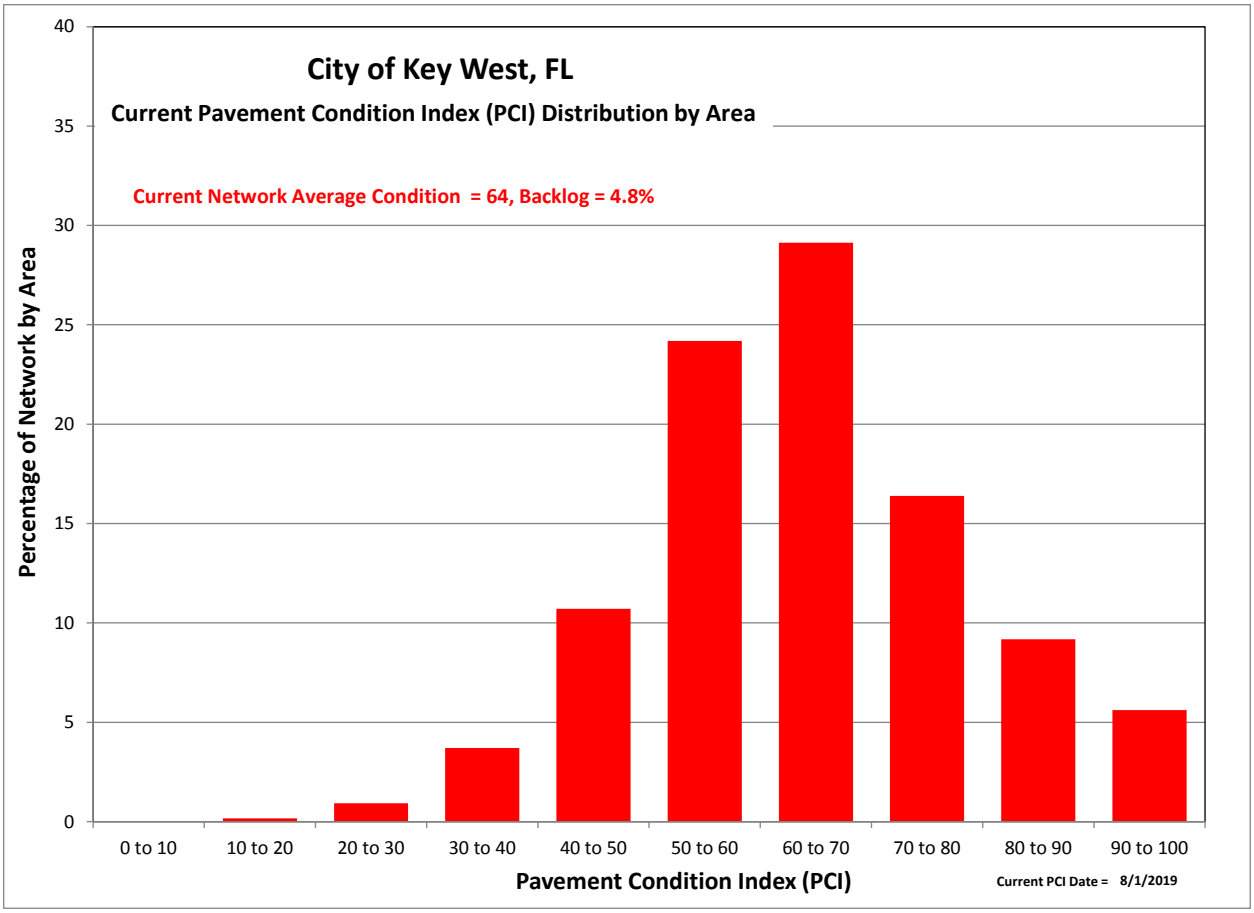

Figure 9 – Roadway Network Present Status

- This is reflective of a moderately aged network that has had some roadway renewal effort.
- Simultaneously, the City has a moderate sample of streets that are approaching the end of their life where surface based rehabilitations, such as overlays, can be effective.
- Traditionally we expect to see a bell curve that is skewed to the right and centered between a PCI of 60 and 70 (as highlighted in **Figure 8**). The Key West network curve illustrated above follows this norm and shows the positive impact of recent roadway renewal effort over the last several years.

The following graph **(Figure 10)** plots the same pavement condition information, but instead of using the actual Pavement Condition Index (PCI) value, descriptive terms are used to classify the roadways.

- Nearly nine percent (8.8%) of the network can be considered in Excellent condition and require only routine maintenance. The target value for Excellent streets should be 15%, so the Key West network fails to meet this condition.
- Twenty-two percent (22.4%) of the network falls into the Very Good classification. These are roads that benefit most from preventative maintenance techniques such as microsurfacing and slurry seals; which are extremely effective in extending pavement life by 'water-proofing' the surface to prevent cracks from expanding and causing premature failure.
- Twenty-nine percent (29.1%) of the streets are rated as Good and are candidates for lighter surface-based rehabilitations such as thin overlays or slight panel replacements.
- Thirty-five percent (34.9%) of network can be considered Fair to Marginal condition representing candidates for progressively thicker overlay-based rehabilitations. If left untreated, they will decline rapidly into reconstruction candidates and a sharp uptick in backlog for Key West.
- The remaining four percent (4.8%) of the network is rated as Poor or Very Poor, meaning these roadways have failed or are past their optimal due point for overlay or surface-based rehabilitation and may require progressively heavier or thicker forms of rehabilitation or total reconstruction.

4.5 CONDITION BY FUNCTIONAL CLASSIFICATION

Figure 12 highlights the pavement condition distribution for the *Collector, Local and Local-Old Town* streets. Keep in mind that collector and Local-Old Town roadways, the streets that have the majority of traffic use and link various parts of the city together, may be considered the thoroughfares of the city and during the budget development process, should receive the highest priority when selecting rehabilitation candidates.

- The **Collector network** has an average PCI of **71**
- The **Local network** has an average PCI of **64**
- The **Local –Old Town network** has an average PCI of **61**

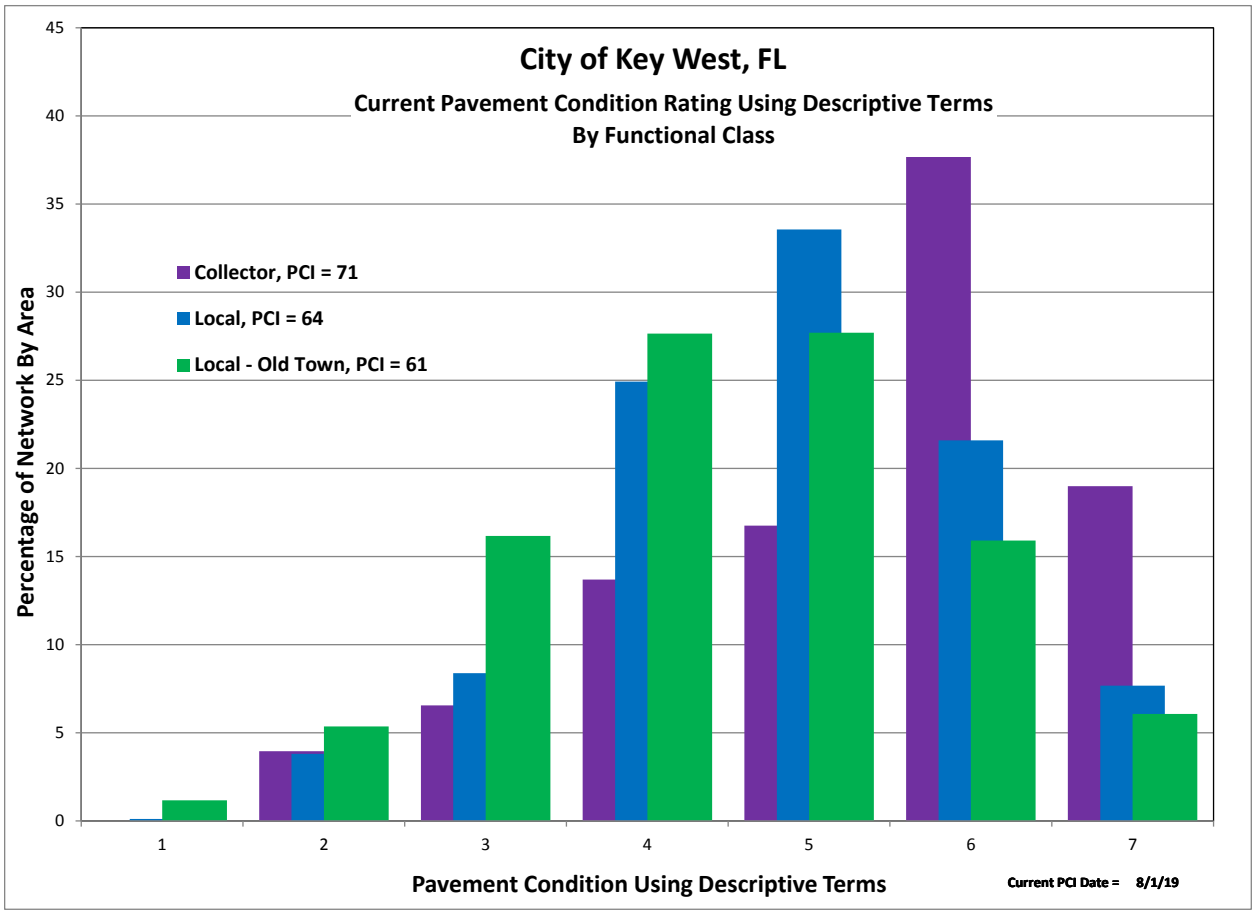

Figure 12 – Condition Rating by Functional Classification

4.6 STRUCTURAL AND LOAD ASSOCIATED DISTRESS ANALYSIS

Structural testing was performed on all roadways maintained by the City of Key West using a Dynaflect device. The purpose of the structural testing was to identify the relationships and interactions between pavement quality, life expectancy and rehabilitation strategies. The structural analysis facilitates a much more in-depth analysis of the City's transportation corridors.

Surface distresses may be categorized into two classifications – load associated distresses (LADD) and non-load associated distresses (NLAD). Load associated distresses are those that are directly related to traffic loading and structural capacity. Non-load associated distresses are those that result from materials or environmental issues including shrinkage (transverse) cracking, bleeding and raveling. Generally, load associated distresses affect the overall condition score more than non-load associated distresses – as is the case in Key West. For asphalt streets, roadways were classified as Weak, Moderate, or Strong.

The purpose of the structural analysis is twofold:

- The structural analysis provides input into which performance curve each segment is to use – performance curves are used to predict pavement deterioration over time.
- Structural analysis assists in rehabilitation selection by constraining inadequate pavement sections from receiving too light of rehabilitation and conversely, identifying segments suitable for lighter weight treatment.

Figure 13 plots the relationship of the load associated distresses (shown in red) against pavement condition. As can be seen from the plot, at higher PCI scores, most pavements fall into the moderate strength classification as the distresses have not yet begun to manifest themselves into severe failures. As the PCI score drops, the load associated distresses typically affect the PCI score to a higher degree with more segments being classified as weak. Conversely, segments that have a declining PCI score and low LADD, are classified as strong as they display few load associated failures. High PCI score (above 60) rehab selections should focus on pavement preservation activities such as surface treatments or thin overlays, possibly with some localized pavement repairs and crack sealing.

The sum of the Load-Associated Distress deducts (LADD) is also used to qualify the appropriate rehabilitation strategy selection in addition to the overall pavement condition score. For example, a street that has a good PCI score (that is between 60 and 70) and is displaying relatively low load associated distress deducts would be a suitable candidate for a surface treatment in place of a thin overlay in that the PCI score is more influenced by materials issues such as transverse cracking or raveling.

Overall, the low amounts of streets exhibiting weak performance can generally be attributed to poor subgrade conditions, insufficient pavement thickness and increased traffic loading – in particular heavy, side-loading garbage and recycling trucks (an unintended consequence of green initiatives) along with school buses and delivery vehicles. The average weight of these vehicles coupled with tire pressure and configuration today compared to those from a few decades ago has increased drastically.

- The upper black diagonal line identifies segments that have a high ratio of load associated distresses compared to their PCI score. These segments are classified as weak.
- The lower black diagonal line identifies segments that have a low ratio of load associated distresses compared to their PCI score and are classified as strong.
- Segments that fall between the two lines are assigned moderate pavement strength.

The sum of the Load-Associated Distress deducts (LADD) is also used to qualify the appropriate rehabilitation strategy selection in addition to the overall pavement condition score for any section not tested by the Dynaflect.

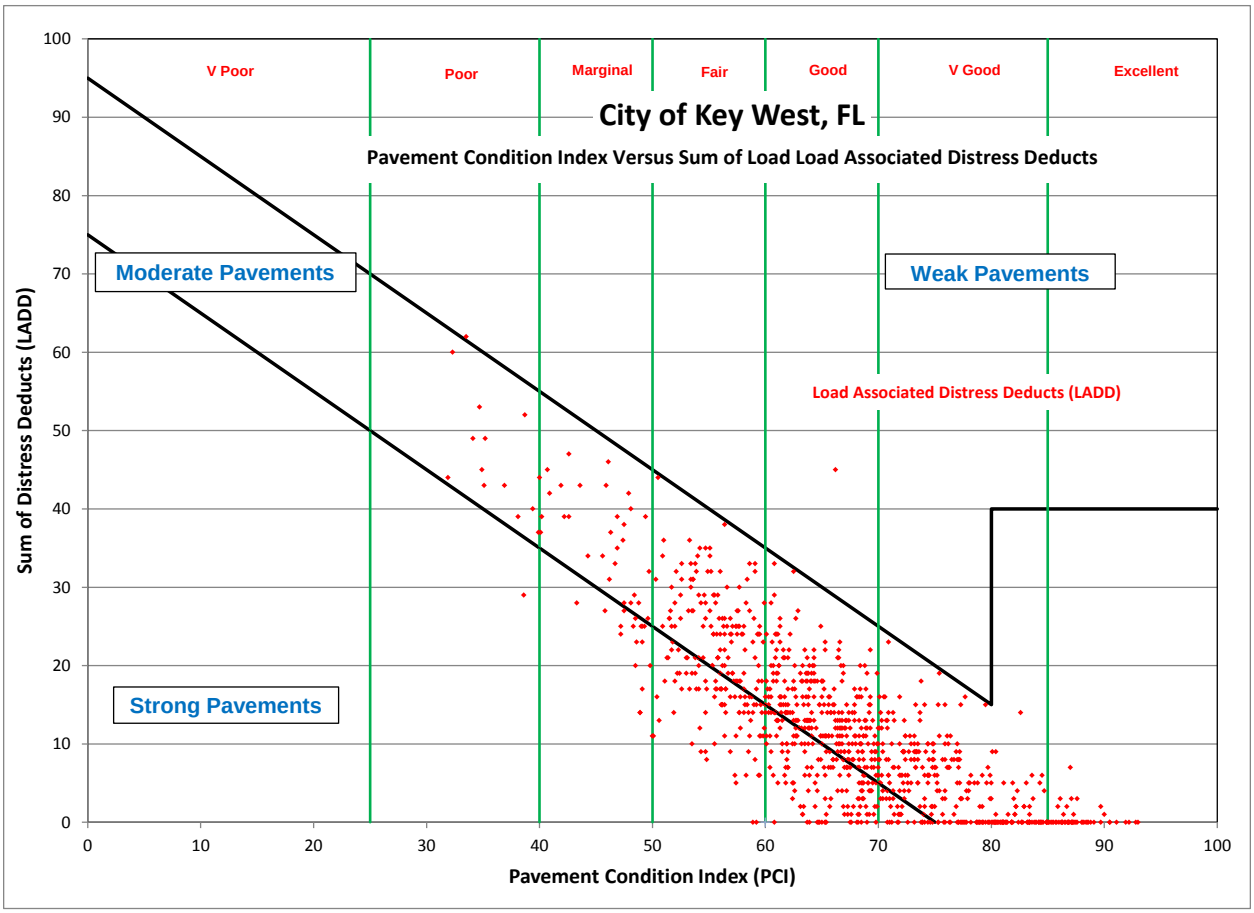

Figure 13 – Pavement Condition Index versus Sum of Distress Deducts

Figure 14 below presents the structural adequacy of the roadway network against its average pavement condition, with each marker representing one segment of roadway. The diagonal black line in the plot provides an indication of roadway segments that are performing above structural expectations and those that do not provide full structural benefits over the life of the pavement. While the structural score does factor into the overall condition index, it also aids in the selection of appropriate rehabilitation strategies by restricting the ability to apply too thin of an overlay on a weak pavement section.

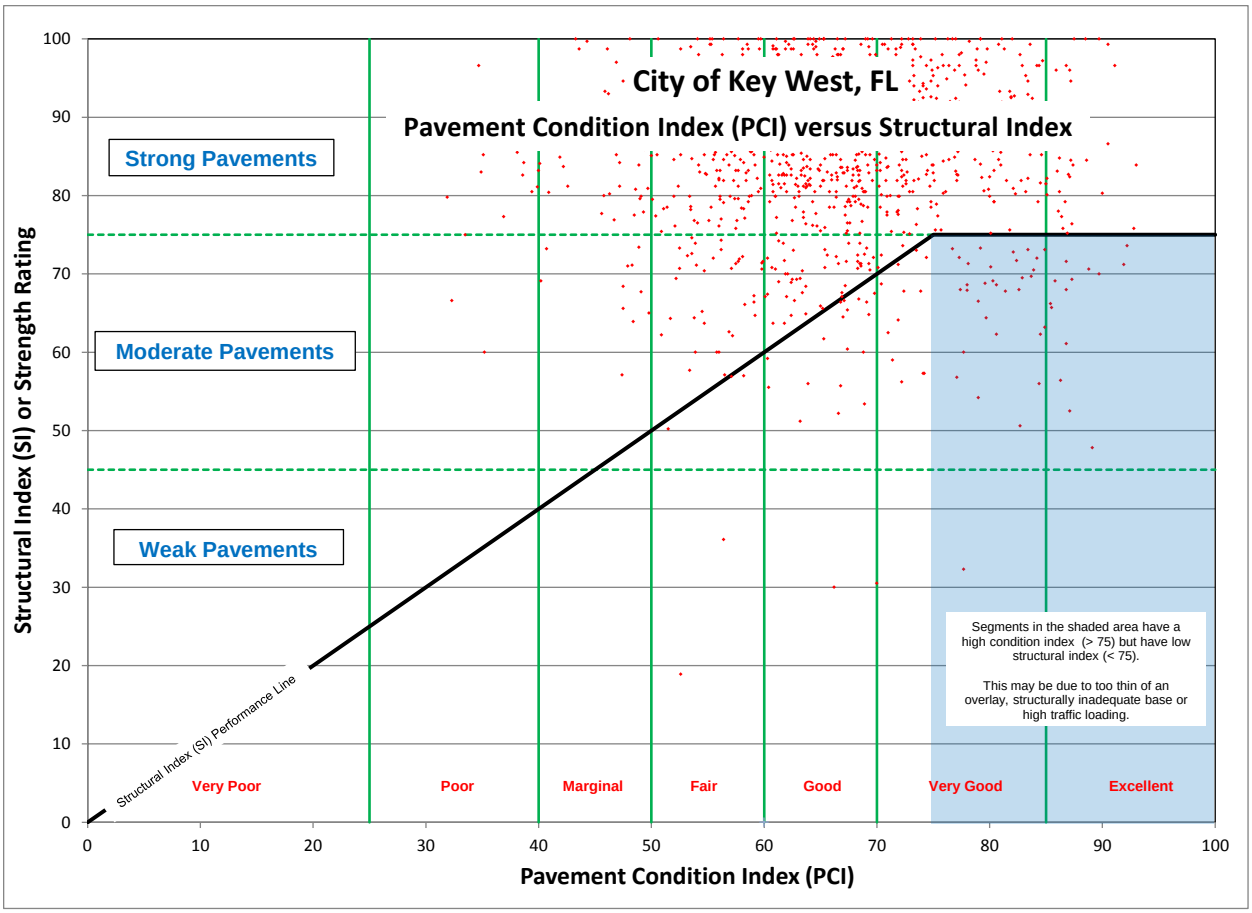

Figure 14 – Structural Adequacy of the Roadway Network

5.0 REHABILITATION STRATEGIES AND BUDGET DEVELOPMENT

5.1 KEY ANALYSIS SET POINTS AND PAVEMENT PERFORMANCE CURVES

Pavement management analysis requires user inputs in order to complete its condition forecasting and prioritization. IMS utilized principles of pavement engineering, deterioration models representative of Key West, and the availability of rehabilitation techniques to create an efficient multi-year pavement management program that is tailored for Key West's specific situation.

Some of the highlights include:

- The pavement performance curves that are used to predict future pavement condition. Asphalt streets are classified as weak, moderate, or strong, and then assigned the appropriate pavement performance curve based on their functional classification to use in the analysis.
- The shape of performance curves reflect the concept of deferred maintenance and salvage life. Instead of dropping to an absolute PCI value of 0 after 40 years of service, the curves are designed to gradually approach the entire pavement life of approximately 50 to 60 years depending on pavement type. This indicates the notion that once a street deteriorates past a specific threshold, about a PCI of 20, age becomes less important in rehab selection.
- Priority ranking analysis uses prioritization for rehabilitation candidate selection. It is designed to capture as many segments in their need year based on the incremental cost of deferral. The higher the functional classification of a street, the higher priority a segment is given.

Rehabilitation Strategies and Unit Rates

The rehab strategies and unit rates used in the pavement analysis can be found on the following page. Some important parameters include:

- **Rehab Code and Activity** – The recommended rehab activities for any given PCI range may vary due to pavement strength and functional classification. For example, a strong road between a PCI of 40 to 50 may receive a moderate overlay, while a weak road may receive a thick overlay.
- **Unit Rates** – The rehab costs are presented on a per square yard basis for each pavement type, functional class, and rehabilitation activity combination. The rates were developed with extensive input from the City to ensure costs accurately capture the challenges unique to Key West. An additional burden to all costs was also added to cover City overheads, design and engineering and inspection. Costs for peripheral concrete rehab (valley gutters, inlets, approaches, etc.) have not been included in the analysis.
    - For Key West, the importance of identifying the Local – Old Town functional class was related to the additional costs related to improvements above and beyond those required for Local roads in the newer sections of town.

The unit rates are reflected in the network value, final budgets, and average cost/mile for doing work in Key West.

**Unit rates vary slightly between functional classes*

Min PCI, Critical PCI, and Max PCI: These define the Pavement Condition Index (PCI) range applicable to the rehab selection. The Critical PCI defines when a segment is in its need year and is deemed to be critical, otherwise if deferred, the street declines in PCI past the point which the rehabilitation is no longer appropriate. Generally the Critical PCI falls 2 to 4 points higher than the minimum PCI applicable for each rehab activity.

Reset PCI: These values represent the post-rehab starting value for PCI in order to compensate for the fact that a rehabbed road is not expected to have the same life cycle as a new pavement. The reset PCI values are dependent on all structural defects being adequately remedied and has been factored into the unit rate for each rehab type.

Figure 15 graphically presents the application of pavement rehabilitations for asphalt streets by PCI and functional class.

PCI Range	Functional Classification		
	Local	Local - Old Town	Collector
	Rehabilitation Strategy		
100 to 85	Routine Maintenance: Crack Seal, etc.		
85 to 70	Preventative Maintenance: MicroSurface / Slurry Seal		
70 to 60	Thin Overlays		
60 to 40	Moderate & Thick Overlays		
40 to 0	Partial/Full Reconstruction		

Figure 15 – Asphalt (ACP) Rehabilitation Strategies

Selection and Prioritization of Rehab Candidates

The City's pavement management program incorporates a series of user defined values to prioritize and select the street segments for rehabilitation. The rehab selection order is not worst first, but rather designed to capture as many segments in their need year based on the incremental cost of rehab deferral. A Street is considered to be in its need year when it has reached its maximum service life and any further deferral would require a heavier and more costly rehabilitation. The rehab program has been designed to maximize the increased service life for each rehabilitation dollar spent on a segment.

Other factors included in the prioritization process focus on:

- **Need Year** – streets are only selected when they have reached critical PCI and are optimal for rehab selection.
- **Functional Classification** – generally priority is given to higher functional classifications as they provide greater benefits to a larger group of users
- **Pavement Strength** – weaker streets are prioritized higher than stronger ones as they deteriorate faster.
- **Area** – a very slight increase in priority is given to larger projects over smaller ones.

The net result is a program that favors thick overlays, followed by surface treatments and thinner overlays in an attempt to preserves as much pavement as possible with the allotted funds. These are then followed by partial and full reconstructs. This type of prioritization attempts to slow backlog so that it can be addressed at a later date.

The programmed deterioration curves are designed to integrate the pavement condition distribution performance curves for the network, with the applied rehabilitation strategies and their expected life cycle.

It is important to recognize that even though all streets fall into specific rating categories and their respective rehabilitation strategies, it is not until a street falls to within a few points of the lower end of the range that it will become a critical need selected for rehabilitation.

5.2 FIX ALL AND ANNUAL ESTIMATES

Three different approaches may be taken to identify and confirm the amount of funds the City needs to set aside each year to maintain the roadway networks current trends (acceptable PCI, growing backlog). All three are completed externally to the pavement management system and are simply used to validate the final results.

Scenario 1 – Estimated Life Cycle Cost Based on Network Value

An approximate value for the annual street maintenance budget may be quickly determined by taking the total value of Key West's roadway network, estimated at $114.5M, and dividing that by the ultimate life of a roadway – approximated to be 50 years for asphalt and 75 years for concrete. By this method, the annual budget is estimated at $2,289,000.

Please note, the 50 to 75 year lifespan of the roadway is the theoretical life of the roadway surface from construction, until the point at which there not usable surface remaining, it is not simply the lifespan of the pavement surface until the next overlay.

Rehabilitation Estimate Based on Network Valuation

Pavement Type	Network Valuation ($)	Ultimate Life Span (yrs)	Life Cycle Cost ($/Yr)
Asphalt Network	114,399,000	50	2,288,000
Concrete Network	53,000	75	1,000
City of Key West, FL Network Totals:	**114,452,000**		**2,289,000**

Scenario 2 – Estimated Life Cycle Cost Based on Current Condition

A second method to validate the annual budget is to identify the average network PCI and associated rehabilitation requirements, and then estimate the number of miles required to be rehabilitated each year based on a typical life cycle for that rehabilitation activity. For Key West, the average PCI for asphalt roads is 64, which places the Key West asphalt network in the Edge Mill + Thin Overlay range, at an average cost of $36.96/yd^2. Based on this estimate the City needs to spend approximately $2,289,956/year to maintain the current condition average.

Rehabilitation Estimate Based on Network Average Condition

Pavement Type	Pavement Condition Index (PCI)	Rehab Activity	Average Rehab Life Cycle (Yrs)	Miles to do Each Year	Blended Unit Rate ($/yd2)	Average Cost per Mile ($/)	Life Cycle Cost ($/Yr)
Asphalt Network	64	Edge Mill + Thin Overlay (1.5 - 2.0)	17	3.7	36.96	622,700	2,288,874
Concrete Network	15	PCC Full Depth Reconstruction	59	0.0	175.00	2,263,500	1,083
City of Key West, FL Network Totals:							**2,289,956**

Scenario 3 – Estimated Life Cycle Cost Based on Network Deficiency

The third methodology to confirm the required amount of annual funding is to identify the current network deficiency, that is the amount required to rehabilitate all streets in the network assuming unlimited funding, and then divide by the typical life cycle of each rehabilitation activity. This is referred to as the Fix All Estimate and Life Cycle Cost. The rehab strategies listed in the table are generic in nature and not necessarily the final set that was applied to Key West. For Key West, the Fix All Estimate for the network deficiency is approximately $35.9M and the Life Cycle Cost is $2.14M/year, broken down as follows:

City of Key West, FL

Rehabilitation Estimate Based on Current Network Deficiency and Life Cycle Cost

Rehab Code	Rehab Activity	Network Total ($)	% of Total	Arterial	Collector	Local	Local - Old Town	Life Cycle (Yrs)	Life Cycle Cost ($/Yr)
10	Slurry Seal / Seal Coat	815,800	2.3	0	0	563,290	252,540	5	163,200
20	MicroSurface / Chip Seal	106,700	0.3	0	0	0	106,690	6	17,800
30	Edge Mill + Thin Overlay (1.5 - 2.0)	14,429,600	40.3	0	4,065,920	6,360,460	4,003,230	17	848,800
33	Edge Mill + Thin Overlay (1.5 - 2.0) + Strctrl Ptch	1,183,800	3.3	0	364,540	36,500	782,790	17	69,600
36	Edge Mill + Thin Overlay (1.5 - 2.0) + Strctrl Ptch	11,381,800	31.8	0	446,320	7,461,950	3,473,480	17	669,500
40	EM/FWM + Moderate Overlay (2.0 - 3.0)	896,000	2.5	0	798,420	0	97,550	20	44,800

5.3 NETWORK BUDGET: 5-YEAR ANALYSIS MODELS

An analysis containing a total of 10 profile budget runs plus a "Do Nothing" and several benchmark scenarios were generated. Based on outcomes and costs a recommended budget was selected for Key West.

The analysis results are summarized below:

- **Key West (Recommended) Budget** (Green Line) – this represents the annual budget of $3.26M dedicated to pavement preservation and rehabilitation. This level of funding will meet the desired network average PCI score of 70 and maintain an acceptable backlog of 11%.
- **Steady State PCI** – this is simply the funds required to maintain the current network average PCI at a 64. The annual budget required to do so is on the order of $2.16M annually, however backlog (Very Poor & Poor roadways) continues to climb to 14%.
- **Backlog Control Budget –** A budget of 4.60M/Yr will increase the average PCI to 78 while maintaining the backlog at 5%
- **Current Key West Budget –** a budget figure based on historical funding levels. If an average of $1.5M annually is dedicated to the network the PCI score will drop to a 61 and increase the backlog to an unsustainable 16%

The results of the analysis are summarized in **Figure 16** below. The X-axis highlights the annual budget, while the Y-axis plots the 5 Year Post Rehab Network Average PCI value. The diagonal blue line is the results of the pavement analysis (the Key West model profile).

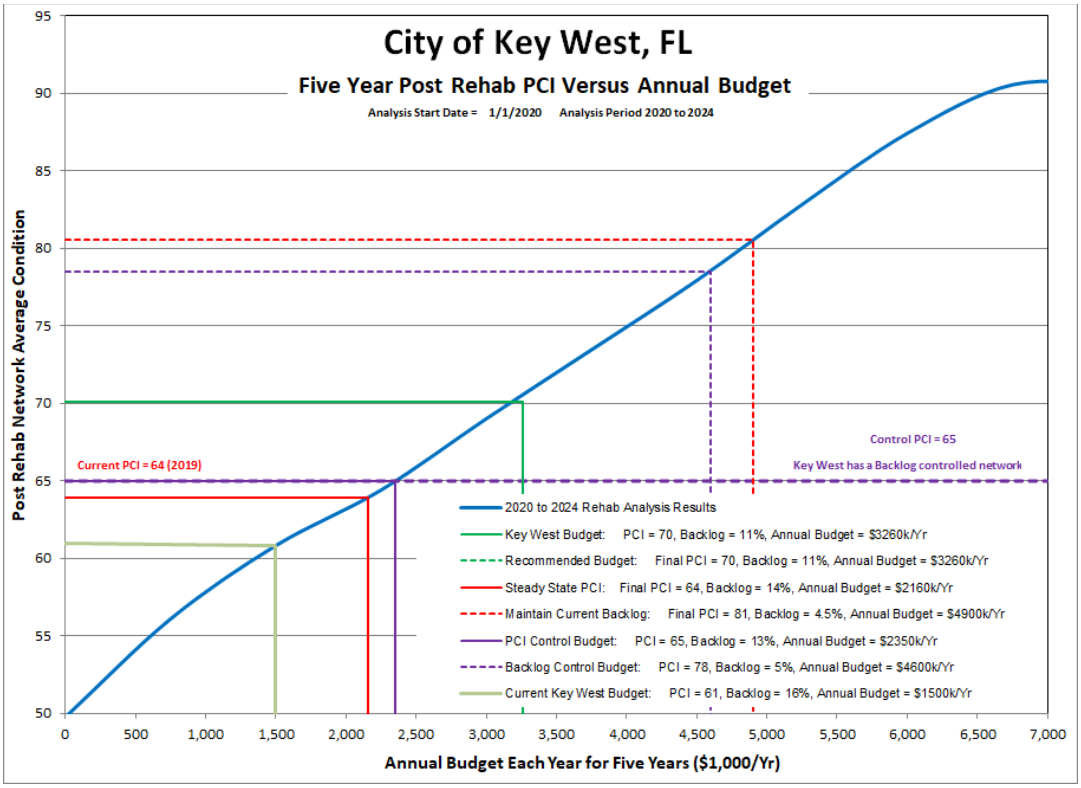

Figure 16 – 5 Year Post Rehab Network PCI Analysis Results

Figure 17 presents the resultant network backlog against annual budget. Similar to Figure 16, but instead of plotting the average PCI score, the blue diagonal line represents the total backlog after 5 years.

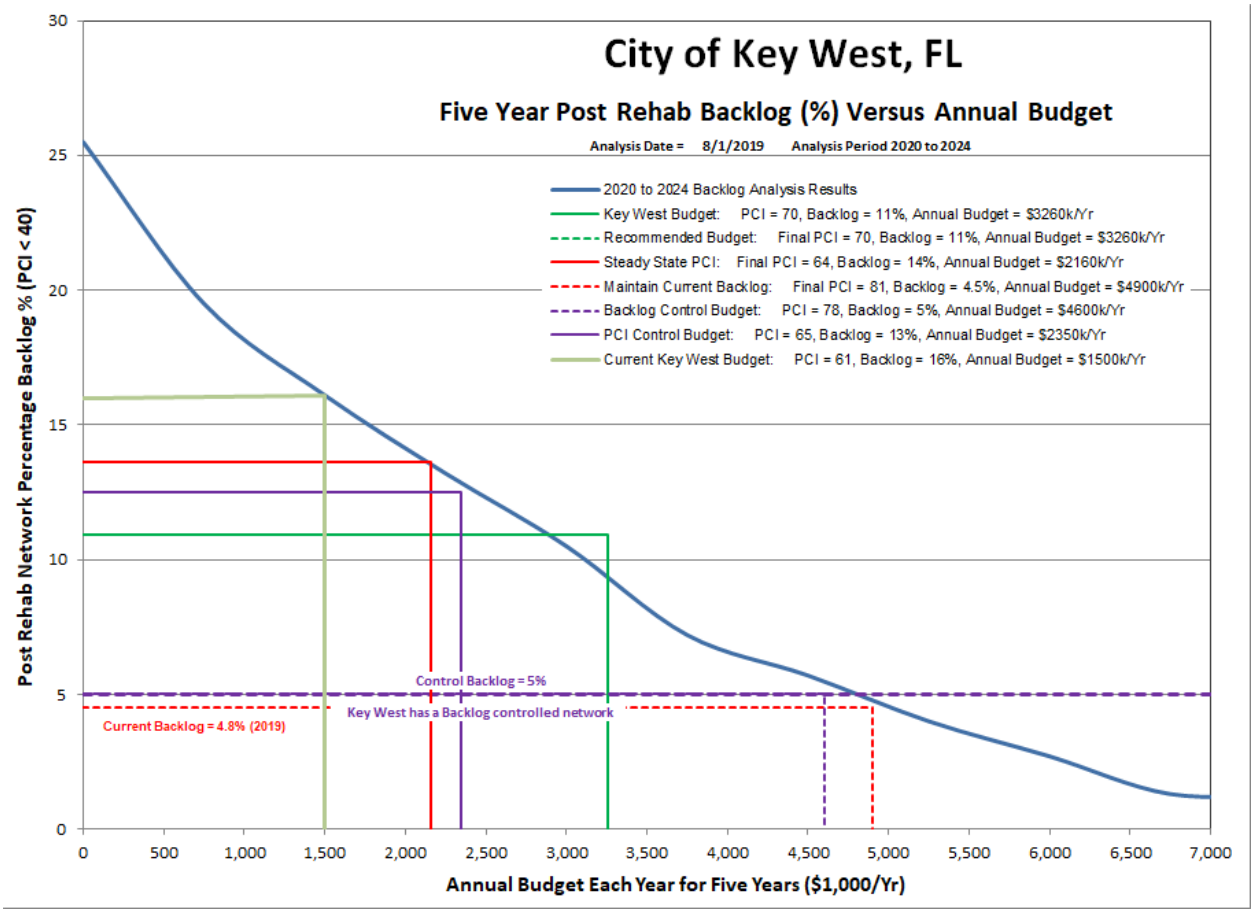

Figure 17 – 5 Year Post Rehab Network Backlog Results

Figure 18 presents the analysis results on an annual basis. This shows that if the budget falls below $2.16M/year (Steady State Budget), over time the overall condition of the roads will deteriorate as backlog continues to grow.

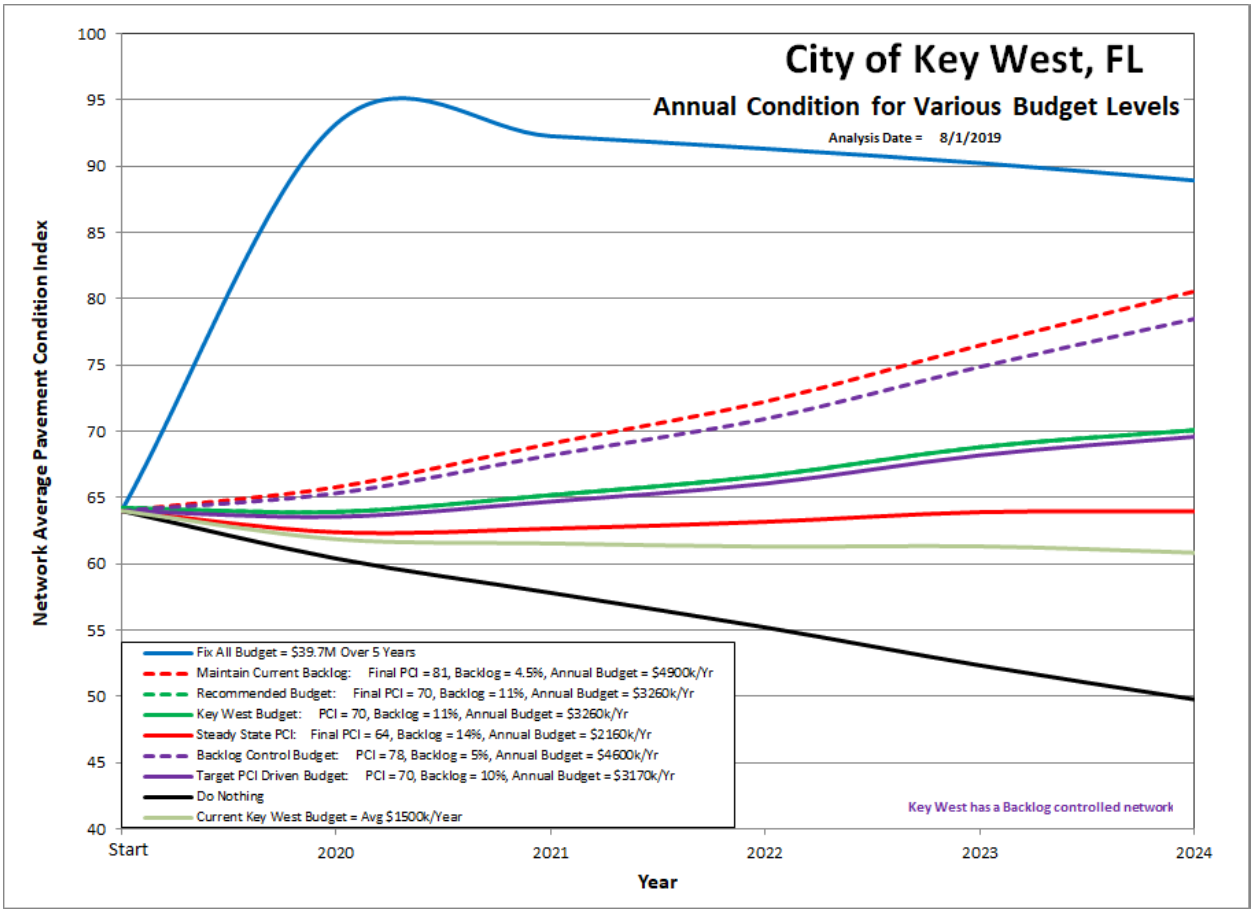

Figure 18– 5 Year Annual PCI

5.4 POST REHABILITATION CONDITION

The following figure (**Figure 19**) compares the current network condition distribution (red) against what the 5 year post rehabilitation distribution would be at with a budget of $3.26M/year (blue). As can be seen in the plot, the Key West budget will increase the overall network's PCI average and increase the amount of roads rated as excellent.

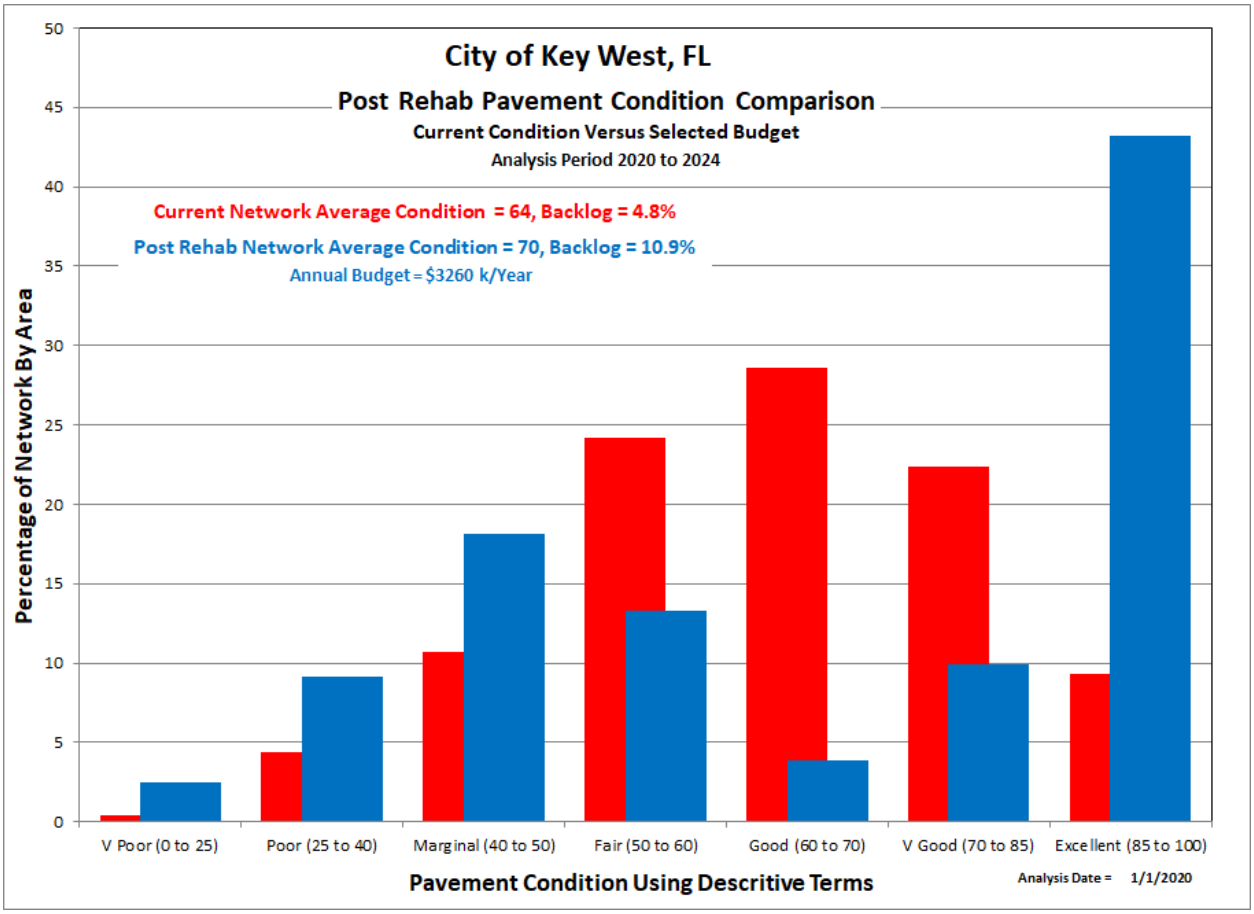

Figure 19 – Five-Year Post Rehabilitation Condition Distribution

Three metrics are used to evaluate the quality of a roadway network, they are:

Average Condition – should be between 60 and 65 at a minimum
Percentage of Backlog – should be no more than 15%
Percentage of Streets Rated as Excellent – should be greater than 15%

5.5 NETWORK RECOMMENDATIONS AND COMMENTS

The following recommendations are presented to Key West as an output from the pavement analysis, and must be read in conjunction with the attached reports.

1. Key West should adopt a policy statement to maintain PCI at or above a 70 while keeping backlog as low as possible.

   An annual budget of $3.26M (dedicated to pavement rehabilitation) will achieve a network average PCI of 70 and backlog will be increased to 10.9%.

2. The full suite of proposed rehabilitation strategies and unit rates should be reviewed annually as these can have considerable effects on the final program.
3. No allowance has been made for network growth. As the City expands or increases the amount of paved roads, increased budgets will be required.
4. No allowance has been made for routine maintenance activities such as asphalt crack sealing, pothole filling, sweeping, striping or patching within the budget runs and analysis. These costs are assumed to be outside the pavement management costs.
5. The City should continue to resurvey their streets every five years to update the condition data and rehabilitation program.

Additional Comments Specific to the City of Key West:

The City should monitor activities related to maintenance and utility work. Visible defects such as localized settling of the pavement and uneven utility cuts can become an issue for the overall performance of the road network in future years. The structural condition of the roadway network is performing well in undisturbed areas, thus many of the localized base failures could be attributed to various factors such as: trench failures, drainage pipe failures, substandard utility top adjustments and water table interference.
