Subject: Building Height – Referendum and LDR Amendment Process

Statement of Problem

The City of Key West is a low lying island with a maximum topographic elevation of 16' above sea level, leaving the city, its residents and assets vulnerable to flooding from high tides, storm surge and sea level rise. Furthermore, the island substrate is permeable limestone and cannot be buffered from water inundation. The City's adopted Climate Action Plan, consistent with regionally adopted standards, anticipates an increase in the number of intense storms in the region and predicts that sea levels will rise between 3" and 7" feet by 2030. According to NOAA tidal gauges, the tide has risen 9" since 1870, causing an increase in flooding throughout the city on a regular basis, limiting access to homes and businesses, and causing water damage during marginal rain storm events and/or high tides.

According to the FEMA NFIP rate maps nearly 2/3 to 3/4 of the City is currently located within the Special Flood Hazard Area and susceptible to the negative effects of sea level rise. In order for the city to adequately protect the city's tax base and private property from high insurance cost and water damage it is critical that the City's Land Development Regulations facilitate the ability for property owners to elevate their property above the flood plain.

Conversely, the current building height restrictions do not anticipate the city's need to adapt for sea level rise and are too low to effectively adapt the existing and future housing stock and commercial structures, built on small properties within a dense urban land fabric. Further, the height restrictions in the Land Development Regulations are restricted by the charter and subject to change only upon approval of a majority public vote at a general municipal election (Charter Section 1.05 (a).

Solution Statement

Staff recommends that the City Commission consider a referendum item for the November election to consider allowing additional height for buildings that elevate their structures in order to construct livable area above the flood plain, but that the maximum amount of height continue to be limited. Based on the scope of protection that the City is interested in providing to its property owners, while balancing the protection of the character of the city, staff is providing four distinct approaches to the referendum for discussion and consideration as stated below.

Why go through the process of amending LDR's related to building height?

- 1. Roadblock to property protection Current building height restrictions create a roadblock for property owners attempting to protect their assets.
- 2. Stable tax base Protecting property facilitates stability of property values and tax base.
- 3. BW 12 October 1, 2013 Brigit Waters 12 became effective eliminating the National Flood Insurance Policy subsidy program. Although negotiations have postponed the new flood insurance rates from taking effect they are inevitable. For nonconforming properties (majority of city), the rate increase will be significant. Drastic discounts are provided for elevating structures out of the floodplain with steeper discounts for freeboard protection (see Exhibit 2).
- 4. CRS Rating Creating mandatory building height elevation automatically elevates our CRS rating, systematically lowering everyone's flood insurance rates. Minimal relief from existing height restrictions would help alleviate the legislative barrier that City's has created in order to facilitate the mitigation of our low CRS rating/ flood prone properties.
- 5. FEMA NFIP Rate Map Changes looming loss of 1 foot BFE likely citywide (possibly by 2018) resulting in the need to elevate structures even higher in order to meet FEMA requirements.
- 6. Climate Change Action Plan Adopted Sea Level Rise predicts 3-7" by 2030 and 9-24" by 2060. Meets Adaptation needs for City's Adopted Climate Change Action Plan.
- 7. New BPAS units Minimum of 910 new residential BPAS units to be constructed by 2023 required to be built 1.5' above BFE.
- 8. Timely LDR Amendment Overhaul Process beginning now.
- 9. Best interest of Community Best interest of property owners and the community as a whole.
- 10. Consistent with existing Comprehensive Plan Policy:

Comprehensive Plan Policy 1.1.12.5: Increased Height: The City shall consider allowing increased heights for new construction or redevelopment if such additional height is justified based on adopted Coastal High Hazard Maps and Storm Surge Flood Maps in order to promote safe new development and redevelopment based on sea level rise predictions. Such additional height must be compatible with surrounding development.

Elements Taken into Consideration of Approaches

The following considerations were all weighed and considered by staff in order to formulate the text approaches proposed.

- Amend the height restrictions by establishing height based on 'flood zone districts' instead of land use zoning districts. Effectively create height overlay districts.
- Limit the number of stories allowed.
- Amend height restrictions by changing the point where height is measured from instead of using the reference point of the crown of the road use:
 - Base flood elevation as depicted in the NFIP Maps; or
 - o Elevation of existing property based on individual flood elevation certificates.
- Critical to provide flexibility for: future changes to flood insurance maps; future rate hikes; storm surge; sea level rise; and mitigation for flood insurance risk for 910 new Building Permit Allocation System units.
- What is the greatest savings in flood insurance rates for elevating a structure above Base Flood Elevation (BFE).

- The changing character of the structural design pattern of the City, from ground floor entries to
 more stilted structures, is not voluntary nor is it controlled by the City, the elevation of structures is
 REQUIRED by FEMA a Federal Agency.
- Balance protection of the built environment (people's homes, businesses and public infrastructure)
 with protection of the City's character by:
 - Creating design standards in future LDR amendments to mitigate changing character of neighborhoods.
 - o Coordinate with HARC to balance protection of the historic structures with protection of the character of the historic district.
 - Provide a minimum and maximum height allowance.
- Consider Florida Building Code exception for contributing structures (FBC Ch. 11). The Building Code exception does not provide relief from the rising flood insurance rates.
- Consider whether the amendments should allow for protection of most of the existing structures or just some:
 - How much height is needed to protect almost all of the existing residential housing stock on the island? (Worst case scenario) Will the approach accommodate existing structures in the lowest lying areas (SF district)?
 - o Is it more important to protect the character of the island at street level or moderately above, or to take a long-range approach to sea level rise and allow more significant height changes?
- November 4, 2014 Timeline for ballot request (see Exhibit 1 attached schedule).
- Referendum is no cost to the City.

Draft Approaches – Referendum Language (75 words or less): In order to provide the City with the most reasonable approach to changing height possible. Staff has provided the following options for consideration of referendum language:

Option 1. In city areas wherein the maximum building height is 35 feet or less, should the building height restrictions contained in the land development regulations be amended to allow one foot of additional building height for each one foot of elevation above the base flood elevation of up to 5 feet within the VE and AE flood zones on NFIP's rate map to protect against flood damage and lessen the cost of flood insurance citywide?

Positive and Negative Considerations of Option 1.

Positive

- 1. Protects the existing height and character of districts outside of the Special Flood Hazard Areas such as the majority of the Historic District.
- 2. All of residential neighborhoods would still maintain a maximum height of 35-40'. Below Tree height.
- 3. Responds to Federal and local request to improve the City's Community Rating System (CRS) by FEMA.
- 4. Shows leadership on a national level.
- 5. Provides flexibility for future FEMA Flood Map amendments.
- 6. Accommodates potential 3' sea level rise predictions.

- 7. In some cases it may provide space for property owners to park or have storage beneath the house.
- 8. Potential to invite development raising property values.
- 9. Limits amount of legislative changes necessary (see below).

Negative

- 1. The character of the traditional, ground level neighborhoods, characteristic of the single family zoning district, will begin to change. Particularly in the lowest places on the island.
- 2. Perception of massing and scale.

Option 2. In city areas wherein the maximum building height is 35 feet or less, should the building height restrictions contained in the land development regulations be amended to allow one foot of additional building height for each one foot of elevation necessary to elevate buildings to the minimum flood elevation or up to 3-4' of freeboard within the regulated flood zones on NFIP's rate map to protect against flood damage and lessen the cost of flood insurance citywide?

Positive and Negative Considerations of Option 2.

Positive

- Provides protection of the height restrictions while ensuring that most existing buildings (particularly residential) can be elevated to meet FEMA and Florida Building Code requirements (BFE +1).
- 2. Provides flexibility for voluntary elevation of the structure of up to 3-4' of freeboard in order to prepare for sea level rise and changing NFIP Maps.
- 3. Allows property owners to maximize flood insurance savings for up to 3' above freeboard.
- 4. Protects the existing height within reason
- 5. Responds to Federal and local request to move towards improvements to the City's Community Rating System (CRS) by FEMA.
- 6. Shows leadership on a national level.
- 7. Provides flexibility for future FEMA Flood Map amendments.
- 8. Accommodates potential 3' sea level rise predictions.
- 9. Potential to invite development raising property values.
- 10. Limited amount of legislative changes necessary (see below).

Negative

- 1. The character of the traditional, ground level neighborhoods, characteristic of the single family zoning district, will begin to change. Particularly in the lowest places on the island.
- 2. Perception of massing and scale.
- 3. This approach would not guarantee a max height of 35-40'.

Option 3. Should the definition of building height contained in the land development regulations be amended to require height be measured from the NFIP Rate Map Base Flood Elevation, instead of the crown of the road, to protect buildings against flood damage and lessen the cost of flood insurance citywide?

Positive and Negative Considerations of Option 3.

Positive

- 1. Based on the Federal elevation requirements for flood prevention
- 2. Responds to Federal and local request to improve the City's Community Rating System (CRS) by FEMA.
- 3. Shows leadership on a national level.
- 4. Provides flexibility for future FEMA Flood Map amendments.
- 5. Accommodates potential 3' sea level rise predictions.
- 6. In some cases it may provide space for property owners to park or have storage beneath the house.
- 7. Potential to invite development raising property values.

Negative

- The character of the traditional, ground level neighborhoods, characteristic of the single family zoning district, will begin to change. Particularly in the lowest places on the island.
- 2. This option allows the greatest height changes
- 3. This approach changes where height is measured from therefore changing the baseline that has already been used to create the city's massing and scale.
- 4. More legislative changes necessary (see below).
- Option 4. Should the definition of building height contained in the land development regulations be amended to require height to be measured from the existing grade of the property as measured by a property specific Elevation Certificate instead of the crown of the road to protect against flood damage and lessen the cost of flood insurance citywide?

Positive and Negative Considerations of Option 4.

Negative

- 1. Difficult to understand.
- 2. The character of the traditional, ground level neighborhoods, characteristic of the single family zoning district, will begin to change. Particularly in the lowest places on the island.
- 3. Perception of massing and scale
- 4. Does not provide flexibility for future FEMA Flood Map amendments.
- 5. This approach changes where height is measured from therefore changing the baseline that has already been used to create the city's massing and scale.
- 6. This approach will help the least amount of properties.
- 7. More legislative changes necessary (see below).

Option 5. Do nothing

Positive and Negative Considerations of Option 5.

Positive

- 1. Protects the existing height of the city
- 2. No additional work for staff

Negative

- 1. Does not respond to Federal and local request to improve the City's Community Rating System (CRS) by FEMA.
- 2. Does not provide a mechanism to alleviate the FEMA elevation requirements.
- 3. Limits ability to adapt to future FEMA Flood Map amendments.
- 4. Will result in additional height variances.
- 5. May result in more costly demolition of existing structures instead of the retrofit or elevation of existing structures.
- 6. May result in takings
- 7. More and more private and public property will be subject to flooding and or insurance defaults due to height restrictions that prevent existing structures
- 8. Land Development Regulations will continue to prevent new or existing structures from elevating to protect themselves from rising sea level, storm surge, high tides, heavy rain events and raising insurance rates. The city may be subject to lawsuit.
- 9. Many properties may go into foreclosure due to inability to pay high flood insurance costs.
- 10. Tax base may be negatively affected.
- 11. The City's CRS rating will remain stagnant and low, and citywide flood insurance rates will remain high.

Legislative Considerations:

Options 1-4 are supported by Comprehensive Plan Policy 1.1.12.5 for Increased Height as described above; although, other legislative changes would be required dependent on the approach as follows:

Option #1 and #2 supports limited policy amendments to the Land Development Regulations and HARC Guidelines as follows:

- Changes to the LDR's would be limited to new language in Chapter 122 including: the Supplemental District Regulations, and perhaps the addition of references to each zoning district Section for clarity.
- HARC Guidelines Amendments:
 - New Construction (p. 38, #2) Revise policy related to elevation of building above FEMA requirements.

Options #3 and #4 require changes to the Comprehensive Plan, Land Development Regulations and HARC Guidelines as follows:

• Amend Comprehensive Plan Policy 1-1.1.3: Intensity Defined:

Policy 1-1.1.3: Intensity Defined. ...The term "building height" as used in the Land Development Regulations shall mean the vertical distance from the crown of the nearest adjacent street to the highest point of the proposed building....

- Amend the Land Development Regulations for definition of "Building Height" Chapter 86-9.
- HARC Guidelines Amendments:
 - New Construction (p. 38, #2) Revise policy related to elevation of building above FEMA requirements.

Option #4 does not require any legislative changes

Subject: BW-Fix: House Bill 3370 Passed Last Night

As I feared, the bill passed last night by the US House doesn't seem to forestall massive rate increases for Pre-FIRM properties now being required to produce Elevation Certificates for the first time.

In the past, Pre-FIRM properties - those built prior to the flood maps (before 1975) - were all presumed below flood to some undetermined depth, and all rated essentially the same. BW-12 changed that universal Pre-FIRM rating.

For the first time, Pre-FIRM policy renewals require Elevation Certificates. Each building is then specifically rated relative to its depth below the flood level for that area.

The greatest impact has been to Pre-FIRM properties that are two or more feet below flood. These Submit-For-Rate policies can't be quoted by local insurance agents, and must be quoted by FEMA.

Homes one foot or so below flood will likely experience moderate increases. One property I'm aware of, where the building is about seven inches below flood is increasing from about \$6k annually to \$9k, gradually during the next few years.

Homes four or six feet below flood, are likely to still suffer massive increases.

However, there's a lot of seemingly double-speak in the bill's convoluted language. We likely won't know how this will all flush-out until FEMA interprets this bill and begins to apply it to actual premiums.

Here's bullet-list of changes from last night House vote (still has to return to the Senate for concurrence):

- Eliminates trigger to full actuarial rates on <u>point of sale</u>; allows assumption of existing flood insurance policies by new property owners. [This should be a great relief to the local real estate, title and banking industries, that experienced an immediate loss of business beginning last Oct. 1st.]
- Creates longer glide path for eventually eliminating the Pre-FIRM subsidy on all properties. Provides for increases of at least 5 percent annually of the current premium (but also subject to the total premium increase cap of either 15 or 25 percent).
- Provides for an optional higher deductible (\$10,000) for residential properties.
- Eliminates Section 207 related to grandfathered rates when maps change. [Key West won't likely be remapped until 2017-18.]
- Requires a surcharge on all flood insurance policies to pay for the longer glide path. \$250 per policy for second homes and businesses, and \$25 per policy for all other structures.
- Mostly provides relief for certain residences, not policies for commercial properties, second homes nor those considered Repetitive Loss Properties (approximately 230 in Key West).

Bottom Line:

Owners of Pre-FIRM homes, two or more feet below flood, will need to seriously consider elevating their residences to ensure affordability of flood insurance...

or...

Contemplate methods of paying off their federally backed mortgages to escape the flood insurance coverage requirement.

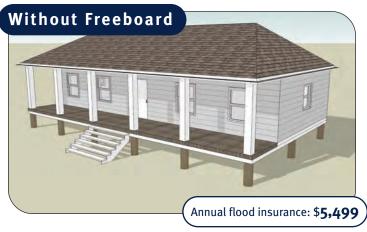

Scott

Raise Your Home, Lower Your Monthly Payments

Protect buildings and reduce monthly expenses with freeboard

Elevating a home a few feet above legally mandated heights has very little effect on its overall look, yet it can lead to substantial reductions in flood insurance, substantially decrease the chances the home will be damaged by storms and flooding, and help protect against sea level rise.

What Is Freeboard?

Freeboard is elevating a building's lowest floor above predicted flood elevations by a small additional height (generally 1-3 feet above National Flood Insurance Program [NFIP] minimum height requirements). Elevating a home a few feet above legally mandated heights has very little effect on its overall look, yet it can lead to substantial reductions in flood insurance, significantly decrease the chances the home will be damaged by storms and flooding, and help protect against sea level rise.

What Are the Benefits of Freeboard?

Increased protection from floods and storms. Storm waters can and do rise higher than shown on Flood Insurance Rate Maps (FIRMs). Freeboard helps protect buildings from storms larger than those that FIRMs are based on, and provides an added

margin of safety to address the flood modeling and mapping uncertainties associated with FIRMs.

Better preparation for ongoing sea level rise. Massachusetts has experienced a relative sea level rise of approximately 1 foot over the past 100 years. Since elevations on FIRMs do not include sea level rise, freeboard will help keep structures above floodwaters as storm surge elevations increase.

Greatly reduced flood insurance premiums. Recognizing that freeboard reduces flood risk, the Federal Emergency Management Agency (FEMA, which administers the NFIP) provides substantial (sometimes more than 50 percent) reductions in flood insurance premiums for structures incorporating freeboard. These savings can rapidly accumulate, especially over the life of a normal mortgage.

Example of savings on NFIP premiums with freeboard

e ²		Annual savings in NFIP premiums	Savings over 30-year mortgage	e E	Annual savings in NFIP premiums	Savings over 30-year mortgage
Zon	1' freeboard	\$1,360 (25%)	\$40,800	Zon	\$502 (41%)	\$15,060
	2' freeboard	\$2,730 (50%)	\$81,900		\$678 (55%)	\$20,340
>	3' freeboard	\$3,415 (62%)	\$102,450	⋖	\$743 (60%)	\$22,290

¹ NFIP premiums based on May 2007 rates for a one-floor residential structure with no basement built after a FIRM was issued for the community (post-FIRM rates differ from pre-FIRM rates). \$500 deductible/\$250,000 coverage for the building/\$100,000 for contents.

² **V zones**: This Flood Insurance Rate Map (FIRM) designation refers to coastal areas that are subject to the highest levels of wave energy and flooding.

³ A zones: Also a FIRM designation, coastal A zones are subject to flooding but with less wave energy than V zones (i.e., wave heights less than 3 feet).

What Are the Costs of Freeboard?

The expense of incorporating freeboard into new structures is surprisingly low, generally adding only about 0.25 to 1.5 percent to the total construction costs for each foot of added height, according to a 2006 FEMA-commissioned study (*Evaluation of the National Flood Insurance Program's Building Standards*). The minor resulting increase in monthly mortgage payments is generally more than offset by savings on NFIP premiums. Consequently, adding freeboard typically saves homeowners money.

Consider, for example, a proposed one-story building in the V zone² that will cost \$250,000 to build at minimum legal standards (the NFIP requires that all homes in the floodplain be elevated to at least the base flood elevation [BFE], mapped on FIRMs). According to the study cited above, adding each foot of freeboard to a home on piles or piers adds about 0.4 percent to total construction costs (about \$1,000 a foot in this example). If the owner takes out a mortgage at 6.5 percent APR for the total construction costs, he or she will have lower monthly payments (mortgage plus NFIP premiums) with 3 feet of freeboard, even though the construction costs are higher.

İ	`
\$1,580.17	
+ \$458.25	
= \$2,038.42	
\$1,599.13	(+\$18.96)
+ \$173.67	(-\$284.58)
= \$1,772.80	(-\$265.62)
	+ \$458.25 = \$2,038.42 \$1,599.13 + \$173.67

In this example, adding 3 feet of freeboard saves the homeowner \$265.62 per month, or \$95,623.67 over a 30-year mortgage. Benefits in A zones³ are generally less dramatic, but still substantial. To determine NFIP premiums for a specific property, see a licensed insurance agent.

Who Can Benefit from Freeboard?

Nearly everyone building in floodplains can better protect themselves and their property and save on flood insurance by including freeboard into their construction and reconstruction projects. Additional benefits include:

• **Homeowners** - Whether or not you live in the house year-round, having it elevated increases the chances that

- it will weather storms safely, decreasing your worry and protecting your investment. If you're building a new home, or doing a renovation, ask your builder/designer about incorporating freeboard.
- Builders/contractors Freeboard provides a competitive edge over other builders, allowing you to market the benefits of reduced flood insurance and flood risk to potential buyers. When doing retrofits (especially those requiring bringing structures up to current NFIP standards), explain the benefits of freeboard to your clients.
- Municipalities Encourage the use of freeboard in appropriate private and public construction throughout your community's floodplain. (NOTE: The Massachusetts Attorney General's office has recently rejected bylaws requiring freeboard, but municipalities may promote its use.)
- **Businesses** Freeboard helps: protect your buildings, important records, and inventory from flooding; drastically decrease your recovery/clean-up time after storm; and potentially save your business. The Institute for Business and Home Safety reports that more than 25 percent of businesses that close due to storm damage never reopen.

For More Information . . .

- For technical details on costs of using different flood-resistant building techniques (including freeboard), see the American Institutes for Research's *Evaluation of the National Flood Insurance Program's Building Standards* 2006 study at www.fema.gov/library/viewRecord.do?id=2592.
