MEMORANDUM

DATE: April 5, 2019

RE: 2023 Flagler Avenue

FROM: Karen DeMaria, Urban Forestry Manager, City of Key West

On April 5, 2019, the urban forester and the representative for the property, Kenneth King, did a core drill inspection of the crotch area of the mahogany tree. A 12" long drill bit was used to drill into several areas in the crotch to determine the depth of the decay. If the drill bit proceeds easily into the area, that indicates the presence of decay (Mahogany is a hard wooded tree).

Drill location above- 2" soft then hard wood.

Drill location above-drill bit easily into trunk-10" soft wood.

Drill location above: drill bit easily into the wood-10" soft wood

★: Location of soft/decay wood as per drill bit inspection

●: Location of hard wood as per drill inspection
