Exhibit A - SCOPE OF SERVICES

4.1 Background

Monroe County desires to develop a more accurate representation of ground elevations in the developed portion of the five municipalities of Islamorada, Layton, Marathon, Key Colony Beach and Key West to help guide important planning and design activities. In general, the municipalities would like to develop ground elevations and structural elevations in areas where planning activities are underway to help refine the understanding of existing and potential future conditions. This effort includes, but not limited to, LiDAR scanning and data extraction for all of the roadway centerlines within the municipalities and also the development of spot elevations identified through other technologies such as land surveying, terrestrial scanning and GPS in areas that are undeveloped or where the vegetation canopy is such that aerial or mobile LIDAR may be unable to collect the required data.

While nearly 90 percent of the County's land mass is located on the mainland in the Everglades, less than 1 percent of the County's population lives in this area---more than 99 percent of the population lives in the Florida Keys. The Florida Keys are a series of islands of varying elevations that are all connected via bridges that extend from Key Largo to Key West, FL. The area for this effort consists of the Florida Keys portion of the County represented by the collection of municipal maps contained in **Appendix A1, A2, A3, A4 and A5**

The work under this contract will be primarily focused on developing information that the municipalities may use to consider long-term environmental changes expected in the County. Sea-level rise, for example, is an increasing concern since much of the County is located in low-lying areas where slight increases in sea level could affect large areas within the County. The data generated by this effort will supply the municipalities with the data platform it will need to guide decisions that will help avoid or mitigate such concerns.

4.2 Project Overview

The Consultant shall provide accurate elevations for road rights-of-way (ROW) and other land areas and obtaining information on the land and building first floor elevations as a means of improving long-term decision-making for the municipalities. The anticipated uses include:

- Identifying road elevations and surrounding land elevations to be used in roadway planning and design
- Identify land elevations in low-lying areas of the municipalities that are currently covered by foliage in order to better identify flood elevations in such areas.
- Determine land and facility elevations to enable sea level rise planning and design efforts

- Obtaining “first floor” and surrounding natural grade elevations for public and private structures, as well as building envelope dimensions
- Other tasks (all requiring better land elevation data)

The Consultant shall collect mobile LiDAR data on all roadway centerlines within the municipalities and determine methods for data collection outside of the roadway areas where mobile LiDAR is unfeasible. The County recognizes that the benefit of the mobile LiDAR will extend beyond the study of topography, flooding, and sea level rise to other uses in the developed areas of the municipalities. The municipalities wish to use this information for other infrastructure projects in the near future.

The desired outcome of this effort is to identify to the greatest extent possible accurate land elevations in areas of the municipalities that are of interest.

The Contractor will collect building first floor (threshold) elevations in areas where the mobile LiDAR vehicle can drive past the facilities listed in Appendix A. Other methods including traditional land survey, terrestrial scanning and GPS are not anticipated for this initial authorization. Aerial LiDAR is not authorized unless specifically approved in writing by the County. The Contractor will be asked to determine the most appropriate and effective data collection methods to obtain accurate elevation and building data in the largest land area possible for facilities not observed under this initial authorization, given available funds.

4.3 Project Location

Municipalities: There are five municipalities in the Florida Keys: Key West, Marathon, Key Colony Beach, Layton, and Islamorada.

The municipalities have municipal roads and numerous municipal-owned or operated facilities and parks spread over the 106 linear miles of the area known as the Florida Keys, for which mobile LiDAR elevation data is desired, as follows:

Entity	Number of Road Miles	Number of Facilities (estimated)
Islamorada	69	14
Key West	99	51
Marathon	63	35
Layton	2	1
Key Colony Beach	7	3

The municipalities will provide shape files, if available, showing the road center lines and land areas that are to be scanned and processed. See Appendix A for list.

4.4 Project Phases

The project is anticipated to be implemented in multiple phases corresponding to either geographic areas or functionally similar types of LiDAR data collection. The Contractor will coordinate with the County’s representative(s) to identify a target area for collection, determine the appropriate methods of data collection, and then implement LiDAR data collection subject to County oversight. Potential phases will likely include both a geographic and a functional similarity component. *Examples* of potential phases are as follows:

- Phase 1A: Key West project schedule
- Phase 1B: Key West control survey
- Phase 1C: Key West mobile LiDAR collection for all municipal roads
- Phase 1D: Key West project report

The Contractor will initially be allowed to target, scan and process the demonstration area first.

The Contractor shall supply the survey data along with the calibrated point cloud for the County to evaluate. All survey processes shall follow the Florida Standards of Practice for Surveyors.

The County, as assisted by the services of a retained consultant, will review the scope of coverage achieved with the mobile LiDAR during the demonstration phase (determining the extent of shadows or “holes” in the data), identify the extent of terrestrial LiDAR needed to cover all County facilities and infrastructure within that subsection/area, and then review the costs incurred to date (as well as the anticipated cost to produce usable data) in relation to the expected remaining work to be done, county-wide. Other factors, as deemed appropriate for inclusion by the County and its consultants, may also be considered. The County will provide the Contractor with the consultant’s finding and evaluation. Upon approval by the County that they are satisfied with the results of the pilot, at that point the decision will be made whether to move forward with the remainder of the project work.

Upon review and acceptance of the demonstration area the Contractor will be allowed to collect and process the data for the additional phases in the municipalities. The Demonstration area is anticipated to serve as a **pilot** for data collection efforts to be conducted, with regular coordination between the data collection team and a team of County and municipal officials who will provide input on desired data, interact with the Contractor on results and findings, and provide final direction on the data methods to be collected in other areas of the County.

The next phases, schedule to be determined, are dependent on the outcome of the pilot area and the determination by the County of keeping the municipalities and U.S.1 road work in the scope of work. They may be similar to the following:

- ✚ Key West
- ✚ Key Colony Beach
- ✚ Marathon
- ✚ Layton
- ✚ Islamorada

4.5 Specifications:

A. General

The Contractor will use a terrestrial vehicle to collect georeferenced images and LiDAR data. The vehicle will travel at or slower than the posted speed limits and will be conscious of traffic conditions and will not cause traffic hazards. The Contractor must adhere to the guidelines in NCHRP 15-44 Report entitled, “*The Guidelines for the Use of Mobile LiDAR in Transportation Applications.*” The Contractor will suggest methods to provide data in the off-road area where the mobile LiDAR data is not available due to vegetation or ground slopes that are not visible to the LiDAR scanner. The Contractor will discuss in their proposal methods and technologies that they will use to fill in areas that the mobile LiDAR does not capture. The Contractor is encouraged to offer alternative methods of data collection that will achieve the goals of this project. If alternative methods are proposed, the Contractor will include information regarding the technologies and the methodology and any data regarding accuracy and standards.

B. Equipment and Software

Equipment and software needed to complete this project successfully will be the responsibility of the Contractor. The County wishes to use this information to also determine the first floor elevations of structures adjacent to the ROW. In some cases, there may be vegetation along the roadway that will cause obstructions. To decrease “no data” areas along the ROW, the Contractor will utilize dual head scanning systems to ensure comprehensive coverage of off-road structures. The Contractor will ensure that the equipment is properly calibrated and in working order to meet the project’s accuracy specifications.

C. Targets

The Mobile LiDAR ground control targets will be established utilizing RTK-GNSS. Each target will be observed through two (2) independent observations. The two observations will be inversed to ensure the positions are within 0.1' in both the horizontal and vertical planes.

D. Datum

All data will be collected in the Florida State Plane Coordinate System, East Zone, NAD83 (NSRS 2011) horizontal and NAVD88 (Geoid 2012A) vertical.

E. Survey Conditions

The data will be collected during daylight hours only. The road shall be dry; data will not be collected during any precipitation, including fog.

F. Images

The Contractor will submit imagery that is calibrated and collected by the on-board LiDAR system cameras. For each image, the following information will be provided:

- Camera/Lens model (unique for each camera used)
- Camera Location (State Plane Coordinates for each image)
- Camera Orientation (defined with respect to the projects reference)

Image quality will be consistent and will be a minimum of 5 megapixels. The Contractor shall propose the resolution and field of view of the cameras that will be used. Images will exhibit clarity without any significant blur, reflection or distortion. The images will be sufficiently calibrated that the point cloud data is within 5 pixels. In order to evaluate the alignment, the Contractor will extract approximately 20 CAD line elements representing edges in the point cloud such as building corners, painted lines or other straight lines that can be viewed.

G. Flight Line Alignment

Mobile LiDAR data collected over individual passes along the corridor will be identified as Flight Lines. A flight line is a set of data that is comprised of the point cloud and images collected over a single trajectory in one direction along a road or highway. Each flight line will be identified by a unique ID number in its LAS file. Flight lines that exceed 3 miles in length shall be broken into smaller flight lines to maintain manageable file sizes. The Contractor shall collect at a minimum two flight lines for each corridor. The trajectories do not need to be in the same lane, but they should have a significant amount of common area covered especially on the roadway surfaces. The deviations between these flight lines shall not exceed 0.05 feet.

H. Point Cloud

Point cloud data will be accurate to within 0.05 feet (one sigma at the 67th percentile) and 0.10 feet (two sigma at the 95th percentile) with a relative accuracy of 0.03 foot for horizontal and vertical. The point density will be a minimum of 20 points per square foot.

I. Random Noise

The random noise level shall not exceed a peak-to-peak value exceeding 0.04 foot (+/-0.02 foot). The data will be filtered to remove “noise” that could be caused by other vehicles or errors caused by other objects that do not represent the ground surface.

J. Data Storage

The Contractor will provide the rectified data on network accessible storage devices. The data will be housed by the Contractor on a network that is outside of the County’s network. The rectified data will be accessible for a minimum of two years with an option to make the data available for a longer period of time. The data will be stored in a way that the County can download any portion of the project.
